NIAGARA RIVER GREENWAY PLAN AND FINAL ENVIRONMENTAL IMPACT STATEMENT

NIAGARA RIVER GREENWAY COMMISSION
APRIL 4, 2007
Title of Action: Adoption and implementation of the Niagara River Greenway Plan

Location: Niagara and Erie Counties, New York State

Lead Agency: New York State Office of Parks, Recreation and Historic Preservation

Contact persons:
For information on the plan and planning process: Rob Belue (716) 773-5361
  Rob.belue@oprhp.state.ny.us

For comments on Plan and GEIS: Tom Lyons, Director Environmental Management
  NYS OPRHP
  Agency Bldg. 1, 17th floor
  Empire State Plaza
  Albany, NY 12238
  (518) 474-0409
  Thomas.Lyons@oprhp.state.ny.us

Prepared by: Wendel Duchscherer
  Ecology and Environment
  The HOK Planning Group
  Advanced Design Group
  Synegraphics
  Niagara River Greenway Commission

Date of acceptance by Lead Agency: April 4, 2007

Consideration Period ends: May 3, 2007
SEQR
NOTICE OF COMPLETION OF A FINAL EIS

Date of Notice: April 4, 2007

Lead Agency: New York State Office of Parks, Recreation and Historic Preservation (OPRHP)

SEQR Status: Type I

This notice is issued pursuant to Part 617 of the implementing regulations pertaining to Article 8 (State environmental Quality Review) of the environmental Conservation Law. A Final Generic Impact Statement (FGEIS) on the proposed action described below has been prepared and has been accepted by OPRHP.

Title of Action: Adoption and Implementation of the Niagara River Greenway Plan

Location of Action: The Niagara River Greenway is located in towns and municipalities in Niagara and Erie Counties bordering the Niagara River.

Description of Action: The action involves adoption and implementation of the Niagara River Greenway Plan (Plan). The Plan establishes a unified vision and a set of principles for the Niagara River Greenway. It identifies the assets and resources that make up the Greenway. It sets priorities that suggest the types of activities to target in the near term. It identifies potential funding sources, partnerships and linkages, and addresses key transportation issues that affect the Greenway. The Plan also discusses several high priority “Implementation Concepts” which describe system-wide approaches and strategies for Greenway development.

Availability of FEIS: Copies of the Final Plan/FGEIS are available for review at the following locations: Niagara Greenway Commission Office at Beaver Island State Park, Grand Island; Grand Island Memorial Library, 1715 Bedell Rd., Grand Island; City of Tonawanda Public Library, 333 Main Street, Tonawanda; Kenilworth Library, 318 Montrose Avenue, Buffalo; Earl W. Brydges Library, 1425 Main Street, Niagara Falls; Niagara Falls Public Library-Lasalle Branch, 8728 Buffalo Ave., Niagara Falls; Lewiston Public Library, 305 S. Eighth St., Lewiston; North Tonawanda Public Library, 505 Meadow Drive, North Tonawanda; Ransomville Free Library, 3733 Ransomville Road, Ransomville; Wilson Free Library, 265 Young Street, Wilson; Youngstown Free Library, 240 Lockport Road, Youngstown; Buffalo and Erie County Public Library, 1 Lafayette Square, Buffalo; Kenmore Library, 160 Delaware Road, Kenmore; and online at: http://www.niagaragreenway.org
Agency representatives and the public can provide comments during the consideration period for the Final Plan/FEIS. The consideration period ends 30 days following the date of this Notice of Completion. Comments on the Final Plan/FEIS will be accepted by the Agency until May 3, 2007. Comments should be forwarded to the Agency Contact person.

**Agency Contact:** Thomas B. Lyons, Director
Environmental Management Bureau
NYS OPRHP
Agency Bldg. 1, Empire State Plaza
Albany, NY 12238
Phone: (518) 474-0409
Fax: (518) 474-7013
Thomas.Lyons@oprhp.state.ny.us

**Copies of this notice have been filed with involved and interested agencies and persons including:** the commissioner of NYS OPRHP, NYS Department of Environmental Conservation, NYS Department of State, Municipalities within the Greenway and Greenway Commission Members.

EXECUTIVE SUMMARY

The Niagara River Greenway is a world-class corridor of places, parks and landscapes that celebrates and interprets our unique natural, cultural, recreational, scenic and heritage resources and provides access to and connections between these important resources while giving rise to economic opportunities for the region.

This is the Vision Statement that has guided the development of the Niagara River Greenway Plan. It summarizes the intent of this document and the aspirations for the future of the Greenway.

Niagara Falls

The Vision Statement emphasizes the fact that the Niagara River Greenway has international significance. Niagara Falls is one of the most recognized places in the world. In addition to the Falls, the Niagara River corridor encompasses a variety of world-class features, both natural and man-made.

The Vision Statement also stresses that one of the functions of the Greenway will be to celebrate and interpret this region’s many assets. The Niagara River Greenway will be a way of integrating the ideas and stories that bring the Niagara River corridor to life, revealing the region’s place in history and its connections to the natural and built environment.

The Vision Statement underscores the incredible diversity of assets that comprise this corridor, including natural, cultural, recreational, scenic and heritage resources. It highlights the importance of increasing access to and connections between the region’s many resources through a variety of methods, including signage, “wayfinding” systems, trails, waterfront access sites, overlooks, gateways and interpretive sites, to name a few, and it expresses the optimism that the Greenway can lead to greater prosperity for the region.

At its foundation, the Niagara River Greenway Plan is a means to create connections between the various constituents, organizations and municipalities that comprise the Niagara River Greenway. It is an initiative with broad-based support that will foster consensus. Under the umbrella of the Niagara River Greenway, these entities can advance local and regional agendas for community livability, environmental sustainability, tourism and economic revitalization.

The Niagara River Greenway Plan is the direct response to the State legislation establishing the Niagara River Greenway Commission, but the Plan is also the result of local, grassroots advocacy for the special places that make up the Niagara River Greenway. Throughout, various stakeholders, local leadership and the general public have been integral to the development of this document.

The Niagara River Greenway Plan establishes a unified vision and a set of principles for the Niagara River Greenway. It identifies assets and resources that make up the Greenway. It sets priorities that suggest the types of activities to target in the near-term. It identifies potential funding sources, partnerships and linkages, and addresses key transportation issues that affect the Greenway. The Plan also discusses several high priority “Implementation Concepts,” which describe system-wide approaches and strategies for Greenway development. The report concludes with a Generic Environmental Impact Statement that evaluates the potential environmental impacts of the Niagara River Greenway Plan and a chapter listing substantive comments received along with responses to these comments. This executive summary provides a brief overview of each section.
EXECUTIVE SUMMARY

Chapter 1: Introduction
This chapter sets the context for the Niagara River Greenway planning effort and establishes the Niagara River Greenway boundary. The boundary follows municipal lines and encompasses the municipalities of Porter, Youngstown, Lewiston (Town and Village), Niagara, Niagara Falls, Wheatfield, North Tonawanda, Grand Island, Tonawanda (City and Town), Kenmore, and Buffalo. Beyond the specific boundary of the Greenway, the boundary discussion acknowledges key connections and linkages with other systems, including the Seaway Trail, the Niagara Wine Trail and the Erie Canalway. The Niagara River Greenway boundary is shown in Figure 1.

Chapter 2: Inventory of Greenway Resources
This Chapter provides a summary of the many resources located along the Niagara River Greenway, including parks and public lands, ecological resources, priority conservation lands and heritage sites. The chapter also includes an inventory of existing planning documents.

Chapter 3: Vision and Principles
The vision for the Niagara River Greenway, the foundation for this document, has been discussed above. The principles for the Niagara River Greenway represent the general values that will guide greenway planning toward achieving that vision. The principles promote high-quality, ecologically sensitive and sustainable activities and development. The guiding principles for the development of the Niagara River Greenway are:

- **Excellence** – Existing Greenway resources are globally significant and Greenway projects will meet world class standards.
- **Sustainability** – The Greenway will be designed to promote ecological, economic and physical sustainability for long-term viability and effectiveness.
- **Accessibility** – The Greenway will be designed to provide and increase physical and visual access to and from the waterfront and related resources for a full range of users (youth, seniors, persons with disabilities).
- **Ecological Integrity** – The Greenway will be focused on maintaining and improving the health, vitality and integrity of natural resources and wildlife habitats. Emphasis will be placed on restoring and retaining ecologically significant areas and natural landscapes, both in and over the water and upland.
- **Public Well-Being** – The Greenway will be designed to achieve and promote physical and emotional wellness through the experience that it offers to the public. Availability of both land- and water-based recreational facilities, and access to both active and passive recreational opportunities should be considered in the development of Greenway assets.
EXECUTIVE SUMMARY

- **Connectivity** – The Greenway will increase connectivity and access (trails, pathways, parks, water access), promote the continuity of open space and habitats, and provide for connections to related corridors and resources across the region, including connections at the international border with Canada.

- **Restoration** – The Greenway will be designed to encourage the restoration of ecological resources, the appropriate reuse of brownfields, and the revitalization of existing urban centers along the corridor.

- **Authenticity** – The Greenway will establish a clear sense of “place” and identity that reflects the traditional spirit and heritage of the area. Projects and activities should have a connection to the character, culture and/or history of their location.

- **Celebration** – The Greenway will be designed to celebrate local history, diversity, cultural resources, and the natural and built environments, and will seek to share this diverse tradition with local residents and visitors to the region. Projects that support education and interpretation are encouraged, as are events and activities that help build social interaction and shared experiences.

- **Partnerships** – The focus of the Greenway will revolve around cooperation and reciprocal compromise. Relationships and partnerships must be formed and strengthened to achieve coordination and integration of efforts throughout the Greenway.

- **Community Based** – Greenway planning will reflect the preferences and plans of the local communities, while respecting other stated goals and the communal vision of the Niagara River Greenway.

Building upon the principles, the planning process for the Greenway revealed a number of benchmark concepts that have been articulated as goals for the Greenway. These concepts will help guide collective actions within the region toward realization of the vision for the Greenway. As these goals are achieved, new priorities will be developed, consistent with the Vision and the Principles.

Parade in Village of Lewiston

Initial Greenway Goals are:

- **Improve Access**: provide more opportunities to enjoy the many resources of the Greenway. Methods to achieve this goal include development of gateways to welcome visitors and promote access. Also, development of multi-use trails, water-based trails, waterfront access points, scenic overlooks, and interpretive centers.

- **Make Connections**: physical connections that link destinations and communities; conceptual linkages between Greenway resources; and better connections between the Greenway and its residents and visitors. Foster greater integration of the stories, resources and features that make up the Niagara River Greenway.

- **Protect and Restore Environmental Systems**: for environmental purposes and to promote the future revitalization of the region’s economic health. Ecotourism; interpretive opportunities regarding ecological resources; habitat restoration; and reclamation of damaged areas such as brownfields.
EXECUTIVE SUMMARY

- **Celebrate History and Heritage:**
  the region’s shared history and heritage is a deeply held value. Increase opportunities for “Telling the Story” of the region. Consistent signage and wayfinding system; interpretive centers; and thematic frameworks for coordination of interpretive activities.

- **Spark Revitalization and Renewal:**
  revitalization, reinvestment and renewal in the cities and communities along the corridor through sustainable development, tourism and improved quality of life factors. Reuse of brownfields and downtown “Main Street” development. The ultimate goal is improving the natural environment, the built environment, the culture and recreational offerings along the Greenway to attract residents, visitors and investment.

- **Promote Long-Term Sustainability:**
  investments in existing resources and assets, including rehabilitation and improvement of aging facilities, to ensure their long-term viability and world-class stature.

- **Extend Olmsted’s Legacy:**
  achieving Frederick Law Olmsted’s vision of a necklace of parks and open spaces along the length of the River to build a legacy for future generations.

Chapter 4: Action Plan

Recommendations and implementation concepts for the Niagara River Greenway are provided in the Action Plan. The vision for the Niagara River Greenway will become a reality through hundreds of incremental steps and individual actions. The Action Plan established the foundation that guides collective decision-making for the Greenway, so that all stakeholders will have a sense of how their specific actions contribute to the whole.

A. Criteria: The first section of the Action Plan sets criteria for evaluating and forming projects and activities proposed within the Greenway. Greenway Planning will reflect the efforts of the New York Power Authority to settle with various municipalities and interests in relation to a new 50-year Niagara Power Project license, and the Standing Committees will be responsible for allocating Greenway funds established under those agreements. However, the criteria in the Plan will help the Niagara River Greenway Commission determine if an action is consistent with the Plan. They can also be used to help guide project development, by providing concepts to improve project design. Projects do not need to meet all 10 criteria. The criteria are:

1. **Consistency with Principles:** Projects and activities should strive to be consistent with the Principles for the Greenway. (see Chapter 3). Although this determination is inherently subjective, it provides a baseline for project assessment or development.

2. **Priority Status:** Projects should help achieve the goals for the Greenway (see Chapter 3). The list of priorities, based on the initial goals:
   - Improved access to waterfront resources
   - Development of an integrated trail and park system
   - Restoration of the Niagara River ecosystem
   - Interpretation and education about the region’s cultural, natural and historic resources
   - Revitalization of urban centers

3. **Focus Area:** Projects close to the River within the municipal boundaries of the Greenway, along State designated trails and related assets should be elevated. The focus area was based on local planning documents, including Local Waterfront Revitalization Programs, adjusted to incorporate nearby assets. There will be important and valuable projects that fall outside the focus area.
EXECUTIVE SUMMARY

Projects outside the focus area should help establish strong linkages between the Greenway focus area and the surrounding area.

4. Environmental Soundness: All projects within the Greenway should evaluate potential impacts associated with development and take a creative approach to reduce or remove any negative impacts.

5. Implementable: Project proposals should include a schedule and a realistic assessment of the expected costs associated with the project, including costs of management, operations and maintenance. There should be evidence that the public supports the project through municipal resolution, public record or correspondence. When projects are too large to accomplish in one step, they should be broken into “sub-projects,” with each sub-project having independent value and benefit.

6. Economic Viability: Each project should have a realistic assessment of anticipated economic viability, including consideration of on-going operation and maintenance (O&M) costs. Projects should be encouraged to incorporate sustainability.

7. Local Sponsor or Partner: Projects need a sponsor that will oversee the long-term viability of the project: continued funding needs, operations and maintenance efforts, security, oversight of management and condition and stewardship into the future. The stronger the capacity of the sponsor, the more likely the project will be successful. Joint sponsors are encouraged where feasible.

8. Matching Funds/ Leveraging: It is good policy to leverage the funds to the maximum amount possible. Dedicated Greenway funds should be seen as seed money, employed as “gap” financing, used to leverage other investments or to match grants obtained from other sources.

9. Consideration of other Planning Efforts: Proposals for projects should build upon the great deal of planning work that has been completed throughout the region, and take local goals, values and vision into consideration while meeting best practices and models set forth in federal, state and regional documents including advances in new technology.

10. Clear Benefits: All projects should demonstrate clear benefits to the Niagara River, the Niagara River Greenway and the stated vision of the Greenway as a world-class corridor.

B. Funding Sources: The Action Plan, in conjunction with Appendix D, describes potential funding sources for projects and activities along the Greenway.
C. Operations and Maintenance: An “order-of-magnitude” analysis is provided to measure typical recurring costs that would be expected to occur from the execution of the Implementation Concepts included in the Niagara River Greenway Plan, using actual cost data from similar projects where available. The discussion also includes a framework for measuring and evaluating the potential long-term O&M costs. Additional information about the expected economic and fiscal impacts of the implementation of the Greenway plan is included in the Generic Environmental Impact Statement (Chapter 6) and in a Technical Memo in Appendix G. The Technical memo describes the net positive economic benefits expected to result from the implementation of the Greenway Plan, including macro-economic impacts (jobs, multiplier effects), environmental benefits and quality of life improvements. Initial estimates are that the $9 million per year over 50 years in Greenway funds through the relicensing agreement would result in 162 jobs and approximately $13 million annually in regional income, due to multiplier impacts. Additional funds from other sources spent on the Greenway would further increase these impacts. Net fiscal implications are also discussed.

D. Key Partnerships: The Niagara River Greenway Commission is the visible manifestation of and key advocate for the Greenway. The success of the Greenway, lies in establishing effective partnerships and cooperative relationships among all the partners. The process of developing the plan has highlighted areas of broad consensus and helped develop a greater capacity to move the program forward.

One aspect of this cooperation is consultation regarding potential funding of projects. Currently, the NYPA Greenway funds represent the only dedicated funding available for Greenway projects, although other sources of funding are available for Greenway projects (see Appendix D) and it is possible that additional dedicated funding could emerge. The Standing Committees established under the Relicensing Agreements determine which projects will be funded, but there is a clear requirement that projects funded through the NYPA funds are consistent with the Niagara River Greenway Plan. Project sponsors must consult with the Niagara River Greenway Commission. The Niagara River Greenway Commission can also be an important partner for project sponsors who are applying for funding through federal or state programs, private foundations or other sources. This section of the Plan also indicates how the Plan can be amended, and addresses eminent domain.

E. Linkages: There are a number of existing features and assets that intersect with the Niagara River Greenway system, serving as junction points for interconnections with upland and interior communities. These connecting features represent an opportunity for creating both physical and conceptual linkages between the Greenway and the rest of the Buffalo-Niagara region. They have the potential to draw both residents and visitors to the Niagara River corridor.

Gateway Harbor, Erie Canal

F. Transportation Issues: Ease of transportation and access is a critical factor for the Greenway. The Plan advocates creating an environment where people can circulate comfortably and enjoy all of the Greenway’s assets, activities and attractions. The plan cannot and does not advocate specific designs for the many transportation projects planned.
EXECUTIVE SUMMARY

or being evaluated within the Greenway. Those projects are legally required to undergo a specific engineering, evaluation and planning process. However, proposed transportation projects should strive to be consistent with the goals and policies established in this Plan. The Plan encourages multi-modal opportunities, incorporating features for pedestrians, bicyclists and other transportation alternatives. Transportation projects within the Greenway should avoid creation of barriers between the water’s edge and the neighborhoods surrounding it; they should seek to maximize access to the resources along the water’s edge; and they should prioritize enjoyment of land uses over efficiency of traffic movement. Where there is overbuilt capacity, there should be a preference for returning excess pavement to another use.

G. Greenway Implementation Concepts:
Development of the Greenway is a long-term enterprise that requires building public support and forming partnerships. The Greenway Plan is a conceptual document that looks for opportunities across a broad spectrum of publicly and privately held lands, across more than a dozen municipalities and for a wide range of activities. Unpredictable changes in the economy, environment and lifestyles require a flexible plan and implementation strategy.

The Implementation Concepts illustrate certain high-priority system-wide concepts that will help promote implementation of the Niagara River Greenway. These Concepts can be summarized as Gateways; Connections; Environmental Restoration; Interpretation and Economic Revitalization.

1. Gateway Identification
Gateways are physical or spatial devices that celebrate a transition from one distinct place to another. Within the Niagara River Greenway, gateways will be developed as entrances into the Greenway and as transitions through the Greenway. The use of gateways can also communicate particular messages, themes or attributes of the Greenway. Gateways for the Greenway include:

- **Lake-to-Lake Gateways:** Lakes Erie and Ontario anchor the ends of Niagara River Greenway, reinforcing its physical and symbolic definition as a lake-to-lake greenway.
- **Destination Gateways:** these gateways welcome visitors to the Niagara River Greenway. They provide an opportunity for providing directions to river and lake access points, establish a hierarchy of gateways and integrate Greenway gateways with other systems.
- **Transition Gateways:** transition gateways highlight passage through a cross section of the Greenway, typically over bridges, introducing large numbers of people to the beauty of the Niagara River Greenway and emphasizing the special nature of the Greenway as a location. An emphasis on international cooperation and the mutual intent to protect the natural and cultural resources of the River can occur on the international bridges.
- **Aquatic Gateways:** aquatic gateways have symbolic value and encourage new users. They also offer the opportunity to create places where boaters can tie up and take advantage of landside activities.

2. Accessing, Experiencing and Connecting to the River
Ways to access, experience and connect to the River include scenic overlooks, water access sites, water-based trails, parks, and
EXECUTIVE SUMMARY

recreational trails. Focusing on trails, this implementation concept discusses five gaps in the existing network of trails:

- **Buffalo-Black Rock Channel Area:** multi-use trail along the Black Rock channel connecting the trail at Scajaquada Creek to the Riverwalk.
- **Niagara River Parkway (West River Parkway):** multi-use trail from South Grand Island Bridge to the Buckhorn Bike Path.
- **Grand Island Boulevard:** trail along Grand Island Boulevard from Buckhorn Bike Path to multi-use trail at the South Grand Island Bridge.
- **Devil’s Hole/Power Project Area:** trail from Artpark in Lewiston to Devil’s Hole.
- **Lower River Rd. – Lewiston to Youngstown:** trail linking the Villages of Lewiston and Youngstown.

3. **Protecting, Preserving and Restoring Important Ecological Resources**

This implementation concept identifies elements of the Niagara River ecosystem that are in need of enhancement, improvement or restoration due to the current impairment of their natural functions and values. Critical areas for protection, preservation or restoration include:

- **Upland Areas:** upland areas provide important habitat that contributes to the Niagara River ecosystem. Types of projects include protection, restoration and acquisition of unique woodlands or old growth forested areas, important bird nesting or feeding areas, unique wildlife habitats, grasslands or islands with unique or critical habitat values.

- **Riparian-Floodplain Areas:** riparian areas are critical to the health and vitality of the river because they offer food, shelter and nesting habitat for a variety of species. Project types include erosion repair, pollution control and shoreline restoration.

- **Wetlands:** wetlands are vital to the function and health of the Niagara River ecosystem. Project types include wetland enhancement and restoration, acquisition, habitat enhancement and educational projects.

- **Aquatic Habitat Areas:** the aquatic ecosystem of the Niagara River provides a wide range of features, including food, shelter, migratory routes and spawning habitats. The River is also an Important Bird Area (IBA) of international significance. Project types include restoration of various types of habitats and remediation of contaminated sediments.

- **Impaired Habitats:** Returning impaired habitats to a more natural state can help restore ecological productivity to the River. Types of projects include brownfield or landfill redevelopment, invasive species removal and remediation or correction of combined sewer overflows.

4. **Linking Special Places and Destinations- “Telling the Story”**

This Implementation Concept addresses ways to interpret and share the rich heritage of the Niagara River Greenway. It organizes stories and sites along the Niagara River Greenway into five categories of interpretive venues. It recommends the development of a consistent map graphic to promote a high level of continuity for information about the Greenway across a range of media (signage, web site and print applications).
EXECUTIVE SUMMARY

To support wayfinding, the design of the interpretive signage used to convey the stories should include graphics, materials and construction detailing that is similar to other Greenway signage. Integration of signage, logo, form, color and detailing promotes a strong and consistent identity throughout the Greenway, as does consistency of content. It recommends developing a Wayfinding Standards Manual to articulate these standards and protocols for the entire Greenway.

This Implementation Concept also addresses how to differentiate and integrate the identities of different systems within the Niagara River Greenway (e.g. Greenway and Seaway Trail overlap)

5. Heritage Tourism and Economic Revitalization

Revitalizing the region’s urban centers, celebrating the rich cultural heritage and protecting natural resources are sound economic development issues that can improve the quality of life in the region. Environmental protection and redevelopment work together to help promote economic activity, leading to stronger neighborhoods, a healthier environment, a vibrant economy and increased tourism. Elements of this concept include:

- **Revitalizing Urban Centers:** reinvest in existing infrastructure, consistent with smart growth policies. Enhanced quality of life features create a climate that is attractive to new business, encourages private sector investment and helps build a market for new commercial opportunities.

- **Promote Heritage and Cultural Centers:** most appropriately located in urban locations, the most successful and innovative new cultural centers are those that blur the line between education and entertainment by combining learning activities with interactive experiences.

  - **Develop Ecological Centers:** emphasis on education, research and conservation of natural resources, plants and wildlife. The design of ecological centers should combine landscape with architecture by incorporating the Greenway’s natural features through minimal site impacts.

  - **Promote Interpretive Center Network:** Interpretive centers, trailheads, environmental graphics and interpretation programming need to be organized and located according to a strategic hierarchy in order to promote a rich user experience. The diversity of activities and facilities will encourage visitors of all ages to visit the Greenway on a routine basis.

  - **Support Riverfront Preservation and Restoration:** The fundamental goal of riverfront preservation and restoration is to fulfill the vision of continuous lake-to-lake access along the Niagara River. While much of the Niagara River shoreline is and will remain in private ownership, it is a priority to maintain public ownership and increase public access where feasible, whether through trail access, conservation easements, or other means.

---

NIAGARA RIVER GREENWAY PLAN 2007
EXECUTIVE SUMMARY

Capturing the Vision
The implementation concepts help capture a consistent visual and thematic message throughout the Greenway. Equally important is building upon the unique and distinctive qualities of each place along the corridor. The Niagara River Greenway offers an incredible variety of significant and unique places and experiences that occur within a relatively short linear distance. These places have been defined as “Gateways” and “Reaches.” Gateways are transitions from one distinct place to another, while reaches are distinctive segments of the Greenway between Gateways. The gateways and reaches combine to capture a vision of a contiguous series of special events and places highlighting the Niagara River Greenway’s “unique natural, cultural, recreational, scenic and heritage resources.”

Peace Bridge/ Bird Island Pier

Many of these individual gateways and reaches already have distinct identities. Over time, as the vision for Niagara River Greenway is achieved through the myriad of projects and activities that are and will be implemented along the corridor, the unique and distinct character of these locations will become even more apparent. A world-class user experience will emerge: an enchanting alternation of experiences between gateways and reaches that emphasize the variety of “special places, parks, and landscapes” from one end of the Greenway to the other.

Chapter 5: Municipal, Stakeholder and Indian Nation Input
This chapter summarizes and maps the input received from municipalities, stakeholder groups, Indian Nations and individuals for specific projects and recommendations along the Greenway. These lists are unedited and represent a wide variety of project types at various stages of conceptualization. Some are attached to a specific site; others are system-wide; while others are general in nature. The lists are included in the report as a documentation of public input. Their inclusion does NOT imply endorsement by the Niagara River Greenway Commission, and each proposal must be evaluated individually, based on merits. These lists and maps do illustrate the tremendous amount of work and energy being brought to Greenway issues on the part of a wide variety of municipalities, stakeholders and individuals.

Chapter 6: Generic Environmental Impact Statement (GEIS)
The GEIS provides a discussion of the environmental setting, reasonable alternatives and potential impacts associated with the proposed action, which is the adoption and implementation of the Niagara River Greenway Plan. Implementation of the Plan will result in significant beneficial impacts to wetlands, terrestrial and aquatic resources, water quality, natural habitats, fisheries, and sensitive ecological areas along the Niagara River and its tributaries, particularly as these areas are protected, enhanced, restored, or improved. Protection, preservation or restoration of impaired wetlands will restore their functions and values to their full potential and in turn will result in significant long-term beneficial environmental impacts. The natural environment will benefit both on a system-wide basis and on specific sites by improving habitat for resident and migratory birds, fish and other species. Terrestrial and aquatic
EXECUTIVE SUMMARY

enhancements will result in beneficial social impacts as they add value to aesthetic, recreational and educational opportunities available in local communities. The guiding principles set forth in the Plan also will result in beneficial impacts upon existing land use by enhancing, maintaining and/or preserving areas of open space; developing areas for active recreational opportunities; encouraging redevelopment of vacant or underutilized brownfield sites and improving water access where access is currently limited or obstructed. The region’s economy will benefit from enhanced recreational, cultural and ecotourism opportunities, increased residential property values, increased use of the River ecosystem for tourism and recreational boating, returning brownfields to productive and taxable uses and increased employment due to an influx of visitors and tourists.

While there are some potential adverse impacts, such as short-term and localized land use/traffic impacts in the vicinity of the particular development project, these impacts would not be significant nor would they be expected to adversely impact use and quality of the Greenway as a whole. Future projects may be subject to additional SEQR analysis, depending on the scope and location of that project as well as the potential environmental, social or economic impacts that may result.

While there has been discussion and debate about the details of the Greenway, there has been consistent agreement that the establishment of a Niagara River Greenway will benefit the region. The Niagara River Greenway will serve as a catalyst to a higher quality of life, an improved environment, and a rejuvenated region.

Chapter 7: Comments and Responses
The final chapter of the Plan includes the responses to the comments on the Plan received by the Office of Parks, Recreation and Historic Preservation as Lead Agency under SEQR. Two Public Hearings on the Draft Plan were held in December 2006, which a total of approximately 150 to 200 people attended. A total of 66 persons made oral statements, and many other provided written comments. All together, a total of 128 written and verbal comments on the plan were provided to the Agency. Some changes were made to the Draft Plan based on comments. These changes are identified in Chapter 7, Section A.

All comments were reviewed and summarized by categories. Responses were provided for each substantive comment category. A list of the persons and organizations who provided comments is contained at the end of this chapter.

In general, types of comments received included general support for the concept of a Niagara River Greenway, additional stakeholder input, questions about procedural or organizational issues and comments relating to specific aspects of the plan.
CHAPTER 1: INTRODUCTION

1.0 INTRODUCTION

The Niagara River has been the consistent theme that flows through the history and heritage of the Buffalo-Niagara region. From the aboriginal peoples who looked to the river for its natural resources and sacred places, the Niagara River and Niagara Falls have played an integral role in its development. A wealth of stories that relate the history and heritage of this region center upon the Niagara River.

Old Fort Niagara
Mouth of Niagara River

The earliest explorers recognized the strategic value of the River, which served as the gateway to the vast interior lands of the continental United States. The Portage Road marks the route historically used to bypass the Falls en route to the upper River and on to the Great Lakes. The numerous forts that have lined its shores— including Fort Niagara, Fort George, Fort Schlosser, Fort Porter, and Fort Erie, among others— are a testament to the River’s strategic importance. The Niagara Frontier had a role in all of the early wars of this nation, particularly the War of 1812, as the opposing sides fought for control of both shores.

The Erie Canal, completed in 1825, opened a new era for the Niagara River and its region. The vast interior of the United States was opened for settlement through the gateway of the Buffalo-Niagara region, resulting in extraordinary growth. Erie-Niagara’s population grew from less than 23,000 persons in 1820 to nearly 93,500 in 1840, more than a four-fold increase. The gateway to the west shifted from the mouth of the River and Lake Ontario to the City of Buffalo, where the Niagara River, Lake Erie and the Erie Canal converged.

With the growth of the region, the Niagara River became a key location for industrial development. First, as a source for direct water power, then as the means to generate hydroelectricity, the Niagara River helped propel this region’s industrial growth. The Niagara River Greenway area still bears visible reminders of this manufacturing legacy. The grain elevators and shipping docks in the City of Buffalo, the impressive network of power lines and industrial infrastructure that extend across the region from the Niagara Power Project, the brownfields ready for redevelopment to new uses and the many still active manufacturing uses help illustrate the importance of the industrial heritage of this area.

Niagara Falls

At the same time, the spectacular natural beauty of the cataracts at Niagara Falls secured Niagara’s place as one of the nation’s first and greatest tourist attractions. From its discovery by early settlers, it has attracted large numbers of visitors. The vision of the prominent landscape architect Frederick Law Olmsted helped preserve the centerpiece of the Niagara River corridor from overdevelopment, with the establishment of this nation’s first State Parks.
CHAPTER 1: INTRODUCTION

Park, the Niagara Reservation (now Niagara Falls State Park). Tourism is and will remain a key component of this region’s economic vitality.

The Niagara River and the Falls have consistently played a key role in the heritage and strength of the region. The future prosperity of this region depends on reinventing the Niagara River and the region’s waterfronts to meet changing needs. The waterfront is an ecological resource that is unique to this region, and an important element in dozens of stories in the region’s history, from the Underground Railroad to the birth of the modern environmental movement. The River itself presents a variety of experiences, from the mix of industrial heritage and recreational assets on the Upper River, to the less developed, more natural environment around Grand Island and the Lower River. The rapids, the Falls, the islands and the gorge, all represent unique environments and create a unique sense of place. The cities and towns that line the shores of the River also each have distinct characters that should be preserved and celebrated. These ecological, cultural, economic, and historical assets help establish an authentic “place” that is appealing to residents, visitors and investors alike. Collectively, they represent an opportunity to embrace a 21st century economy built on quality of life, ecological stewardship, recreation and enhanced community character.

A. Purpose of the Niagara River Greenway Plan

The Niagara River Greenway concept grew out of both local grassroots efforts and State-level initiatives. The importance of the Niagara River corridor has been recognized for over a century, as evidenced by Frederick Law Olmsted’s vision in the 19th century. Popular support for improvements at the Falls, increased river access, open space preservation, a “Lake-to Lake” trail system, community revitalization and other elements of a greenway plan have been consistently put forward by the communities along the River. While these efforts have resulted in accomplishments to varying degrees, there has not been a region-wide vision to join these individual efforts together into a coherent whole.

```
“And building on our successful efforts to revitalize Niagara Falls and its park land, and by working with the western New York delegation, let us create a Niagara River Greenway that stretches from Buffalo to Fort Niagara on Lake Ontario.”

Governor George Pataki

State of the State Address, 2004
```

In January 2004, New York Governor George Pataki added impetus to the concept of Niagara River Greenway with a brief statement in his State of the State address. By September 2004, the Governor had signed the legislation creating the Niagara River Greenway Commission. This legislation defined the Commission’s purpose as undertaking “all necessary actions to facilitate the creation of a Niagara River greenway.” As part of the legislation, the commission was directed to develop a plan in order to “enhance waterfront access, complement economic revitalization of the communities along the river, and ensure the long-term maintenance of the greenway.”
The legislation also set forth a list of 15 elements to be addressed in the plan. The full text of the Niagara River Greenway Commission legislation is contained in Appendix A. The Niagara River Greenway Plan has been prepared in response to the legislation, but it is also the result of strong grassroots support for a unified vision and coherent plan for the future of this important resource.

The enabling legislation for the Niagara River Greenway states that this plan must (emphasis added):

1. Recommend the specific boundaries of the greenway within Erie and Niagara counties;
2. Develop a specific vision for the greenway that focuses on linking parks and conservation areas, creating a multi-use venue for the people of the region, and enhancing the tourism potential of the region;
3. Include an inventory of existing parks and other lands under the jurisdiction of state agencies, public corporations and municipalities which may contribute to the purposes of a greenway;
4. Identify such other lands that through acquisition, dedication or redevelopment may contribute to the purposes of a greenway;
5. Identify existing plans and plans under development that can contribute to the purposes of the greenway;
6. Conduct economic analyses of the costs to construct, maintain and market the greenway as part of a strategy for implementation;
7. Consider how the region's industrial heritage can be celebrated and reflected along the greenway;
8. Recommend how the greenway could be linked to upland and interior communities in order to promote linkages to the river;
9. Consider how existing and proposed economic development activities in proximity to the greenway can support and complement the greenway;
10. Recommend cooperative efforts with the province of Ontario and the nation of Canada in furtherance of the objectives of this article;
11. Identify local, state, federal and private sources of funding that could support the purposes of the greenway;
12. Evaluate local, state and federal laws and regulations relating to the purposes of the greenway;
13. Identify ways for the commission to work cooperatively with municipal, state and federal agencies, public and private corporations, not-for-profit organizations, and private property owners and [other] interests to advance and complement the purposes of the greenway;
14. Recommend how portions of the greenway would be managed including a plan for ongoing operation and maintenance that would make the greenway self-supporting; and
15. Include any other information, data and recommendations which the commission determines is necessary to support the purposes of the plan.
CHAPTER 1: INTRODUCTION

This document establishes a vision and a set of principles that can be used to guide proposed actions and plans of the various entities who are working toward building a world-class Niagara River Greenway. It sets priorities that suggest the types of activities to target in the near-term. It identifies potential funding sources, partnerships and linkages, and addresses key transportation issues that affect the Greenway. The Plan also discusses several “Implementation Concepts,” which describe system-wide approaches and strategies for the Greenway. The Action Plan portion of the document concludes with a section on “Conveying the Vision of the Greenway,” which integrates a system-wide approach with the unique character of the component parts of the Niagara River Greenway.

Development of the plan has been an extremely useful process, helping to spark spirited dialogue among various interest groups and the general public. This dialogue and the presentation of various viewpoints has built greater consensus on the future for the Niagara River Greenway, a process that is essential for future progress. The Niagara River Greenway is grounded in the geography of this region, and the Plan describes the assets and resources that are part of that geography. But it is also a conceptual and organizational framework; a way of interpreting the region’s history and imagining its future that serves to connect the people of this region together.

B. What is a Greenway?

Throughout the planning process for this project, there has been a great deal of discussion and debate about what defines a “greenway.” The fact is that there is no one standard definition of a “Greenway.” Greenway concepts range from the very specific, such as targeting a particular trail, to the very broad, encompassing large-scale ecological networks like the Florida Statewide Greenway. While the use of the term “greenways” is relatively new, the origin of the concept can be traced back to Frederick Law Olmsted’s planning theories. Olmsted was an advocate of linked, linear systems of parks, as exemplified by Boston’s “Emerald Necklace” and Buffalo’s Olmsted Park system. The movement toward establishing greenways received greater impetus in 1987, when the President’s Commission on Americans Outdoors promoted the concept of greenways as tools to “...provide people with access to open spaces close to where they live, and to link together the rural and urban spaces in the American landscape threading through cities and countrysides like a giant circulation system.”

While the 1987 President’s Commission on Americans Outdoors increased interest in the concept of greenways, there has been significant variation on how greenways provide this access and linkage. As the various definitions indicate, the exact nature of a greenway depends upon its context and purpose. Some greenways have a recreational focus, while others function more as a scenic byway. Often, a pedestrian or bicycle pathway is an element of a greenway and frequently there is a heritage component. Some greenways function primarily for environmental protection, and may even exclude recreational use.

Despite the lack of a single definition for a greenway, there are several consistent themes in greenway planning. Greenways

City of Buffalo waterfront
CHAPTER 1: INTRODUCTION

should be “green,” with a focus on the protection of important natural resources. Greenways are inherently linear spaces, stretching along a natural or man-made corridor, such as a river, a ridge line, a railway, a road or canal. As such, greenways generally require partnerships and cooperation across different jurisdictions. Finally, greenways support connectivity, linking together parks, open spaces, neighborhoods, and regions while promoting a healthy environment.

Each community must determine the appropriate balance between ecological considerations, access, public health and recreation. In planning the Niagara River Greenway, there have been proponents of a model that is focused on the Niagara River as an ecological resource, and those who support a model patterned after the Hudson River Valley Greenway, which is as much a regional planning pact as a geographically-based greenway. The legislation establishing the Niagara River Greenway envisioned the Niagara River Greenway as a linear system of state and local parks and conservation areas linked by a network of multi-use trails. The intent of the Niagara River Greenway, as stated in the legislation, is to redefine the Niagara riverfront by increasing landside access to the river; creating complementary access to the greenway from the river; augmenting economic revitalization efforts; and celebrating the region’s industrial heritage.

While there has been intense discussion about the details of the Greenway, there has been consistent agreement that the establishment of a Niagara River Greenway will benefit the region. The Niagara River Greenway will serve as a catalyst to a higher quality of life, an improved environment, and a rejuvenated region. The specific vision that has been adopted for the Niagara River Greenway is discussed in Chapter 3 of the Plan.

First and foremost, the Niagara River Greenway is a product of the people of this region. Although the legislation creating the Niagara River Greenway Commission was developed at the State level, its impetus was the accumulated result of many local efforts. Similarly, the vision for the Niagara River Greenway transcends a specific list of places, projects or funds. The Niagara River Greenway is the physical, historic and symbolic heart of this region. By sharing this overall vision for the Greenway, we can move together toward a healthy, revitalized region.
CHAPTER 1: INTRODUCTION

GREENWAY DEFINITIONS

Corridors of land recognized for their ability to connect people and places together.
– Greenways Incorporated – www.greenways.com

Linear open space, such as a path or trail, which links parks and communities around the City, providing public access to green spaces and the waterfront.
– New York City Department of Parks & Recreation- www.nycgovparks.org

A linear space established along a natural corridor, such as a riverfront, stream valley, or ridge line, or over land along a railroad right-of-way converted to recreational use, a canal, a scenic road, or other route; any natural or landscaped course for pedestrian or bicycle passage; an open space connector linking parks, nature reserves, cultural features, or historic sites with each other and populated areas; or a local strip or linear park designated as a parkway or greenbelt."
- State of Florida (Florida Statute Chapter 260, Section 13)

A greenway is a corridor of open space. Greenways vary greatly in scale, from narrow ribbons of green that run through urban, suburban, and rural areas to wider corridors that incorporate diverse natural, cultural and scenic features. They can incorporate both public and private property, and can be land- or water-based. They may follow old railways, canals, or ridge tops, or they may follow stream corridors, shorelines, or wetlands, and include water trails for non-motorized craft. Some greenways are recreational corridors or scenic byways that may accommodate motorized and non-motorized vehicles. Others function almost exclusively for environmental protection and are not designed for human passage. Greenways differ in their location and function, but overall, a greenway will protect natural, cultural, and scenic resources, provide recreational benefits, enhance natural beauty and quality of life in neighborhoods and communities, and stimulate economic development opportunities

“A linear open space established along either a natural corridor, such as a riverfront, stream valley, or ridgeline, or overland along a railroad right-of-way converted to recreational use, a canal, a scenic road, or other route; any natural or landscaped course for pedestrian or bicycle passage; an open-space connector linking parks, nature reserves, cultural features, or historic sites with each other and with populated area; locally, certain strip or linear parks designated as a parkway or greenbelt.”
- Charles E. Little, Greenways for America (1990)
C. Niagara River Greenway Boundary

Under the legislation establishing the Niagara River Greenway, this plan must recommend a specific boundary for the greenway within Erie and Niagara Counties. During the public participation process, there has been a great deal of discussion and debate over the issue of the boundary for the Niagara River Greenway, with vocal and dedicated proponents for various alternatives. The scenarios have ranged from a narrow boundary that focused strongly on the River and its shoreline, to a wider, regional approach.

There are benefits to each approach. The narrower boundary focuses efforts and resources on the River itself. In this model, the boundary of the Greenway encompasses the lands that are targeted for open space protection and environmental restoration. A more targeted Greenway boundary is strongly grounded in a specific geography that is clearly identifiable as a linear, literal “green”-way linking resources, conservation areas and parks.

At the other end of the spectrum is a more regional approach that focuses more on the concept of the Greenway as an organizational structure. In this approach, the Greenway becomes a governance structure that encourages greater interaction and cooperation across the region, and takes a more economic development and tourism-related approach to the Greenway.

The Niagara River Greenway Commission has chosen a boundary that follows municipal lines: the jurisdictional boundary of the Niagara River Greenway is the political boundaries of those municipalities that physically border on the Niagara River, with the addition of the Town of Niagara and the Village of Kenmore. The Niagara River Greenway consists of the Towns of Porter, Lewiston, Niagara, Wheatfield, Grand Island and Tonawanda; the Cities of Niagara Falls, Buffalo, North Tonawanda and Tonawanda; and the Villages of Youngstown, Lewiston, and Kenmore. This boundary is depicted on Figure 1.

There are a number of reasons for using a jurisdictional approach for the official Greenway boundary. The Niagara River Greenway legislation requires that the Plan be approved by the local legislative body of each city, town and village within the designated boundary before it can be submitted to the State for approval. In other words, the City Council, Town Board or Village Board of every municipality that falls within the designated boundary must affirmatively vote in favor of the plan. Therefore, it is important that the boundary be simple to understand and justify, particularly at a local municipal level. Establishing a boundary that includes the entire municipality is a standard practice for this type of regional plan. For example, the boundary established for the Erie Canalway National Heritage Corridor includes the cities, towns and villages—in their entirety—that lie immediately adjacent to the Erie Canal and its historic alignments. The Hudson River Valley Greenway and many of the State Heritage areas also use municipal boundaries to designate their official boundaries. The municipalities that comprise the Greenway area will be the stewards of the Greenway as an entity, and their full support is important for the long-term success of this effort.

The Commission recognizes that efforts and resources should be focused on the Niagara River and its shoreline, which is the heart of the Niagara River Greenway. Mapping of resources and an initial list of existing and proposed projects shows a concentration in the River, along its shores and on adjacent inland areas. Input from the general public
has indicated strong support for a scheme that acknowledges the centrality of the River as the geographic basis for the Greenway. In establishing the priorities and criteria for evaluating programs and projects relating to the Greenway, the Commission has established a focus that will help direct activities and funding. Local Waterfront Revitalization Program boundaries and Coastal Zone Management boundaries formed the basis of the focus area, with modifications to include important adjacent resources, such as major tributaries, downtown “Main Street” areas and other major resources along the River. The focus area will help implement the vision of the Greenway as a linked corridor of parks, places and resources within the communities that make up the political boundary of the Greenway. However, the plan also recognizes that several municipalities do not have jurisdiction of lands immediately adjacent to the river or their waterfront lands are already developed. These municipalities must develop their own priorities in relation to the expenditure of greenway related resources. It is anticipated that these priorities would include but not be limited to, inland parks, open space projects, trail projects and projects relating to destination resources.

Beyond the specific ratification boundary of the Niagara River Greenway, there are important connections and intersections of the Greenway with other designated systems. The Seaway Trail, the Niagara Wine Trail and the Erie Canalway all connect to the Niagara River Greenway. These connection points link the Greenway to upland and interior communities and help integrate the Greenway into wider systems. Projects that enhance these and similar connections are consistent with the Greenway. For a description of these connections, refer to page 11. In addition, the Greenway will enhance opportunities for creating compatible linkages with similar systems in Canada. Linkages improve access to not only the Greenway, but to the many resources and attractions of this region that fall outside the designated geographic boundary of the Niagara River Greenway.
CHAPTER 2: INVENTORY

2.0 GREENWAY RESOURCES

There are a wealth of assets and resources in Western New York that contribute to the character and strength of the region. The Greenway enabling legislation, as noted in the Introduction, requires an inventory of these resources as part of the Greenway Plan. The written discussion of the resources that make up the Niagara River Greenway focuses on the municipalities that fall within the Niagara River Greenway boundary. At the same time, the very nature of some of these resources transcends the Niagara River corridor. Therefore, the accompanying figures show the resources on a regional basis, including inland communities.

A. Existing Parks and Public Lands

Parkland resources throughout the Buffalo-Niagara region and along the Niagara River corridor are numerous. These resources include State, County, and local park facilities. Figure 2 illustrates the location of parks and parklands throughout the region.

The most prominent and highly visited park within the Niagara River corridor is Niagara Falls State Park, which encompasses the lands and waters surrounding the Falls. Visitation at this park is estimated to be approximately 8 million visitors per year. Niagara Falls is the anchor attraction for tourism and tourism development in the region. In addition to Niagara Falls State Park, there is a chain of State Parks along the length of the River that continues both north and south to Lake Ontario and Lake Erie shorelines. State owned lands located within the defined boundary of the Niagara River Greenway from south to north are shown in the table on the following page.

There are several county parks and numerous local parks within the boundaries of the Niagara River Greenway, and many parks in adjacent upland communities, as shown on Figure 2. Most of these parks were designed to serve the recreational needs of local residents, but many are important resources along the Niagara River, attracting visitors from the Western New York region and across the State. These parks include the Tifft Nature Preserve, the Small Boat Harbor, Erie Basin Marina, LaSalle Park, Squaw Island Park, Broderick Park, the Bird Island Pier, Tow Path Park and Riverside Park in the City of Buffalo; Isle View Park in the Town of Tonawanda; Niawanda Park in the City of Tonawanda; Gateway Harbor in the Cities of Tonawanda and North Tonawanda; Fisherman’s Park and Gratwick Park in the City of North Tonawanda; and Lewiston Landing in the Village of Lewiston.

The Frederick Law Olmsted parks in the City of Buffalo and the City of Niagara Falls are also a unique resource of this region. In Buffalo, Olmsted Park System includes Riverside Park, Delaware Park, Martin Luther King Jr. Park, Front Park, Cazenovia Park and South Park as well as a number of connecting parkways and circles. In the City of Niagara Falls, Frederick Law Olmsted was instrumental in the preservation and restoration of the lands that now comprise Niagara Falls State Park, also known as the Niagara Reservation. The New York State Office of Parks, Recreation and Historic Preservation (OPRHP) manages the Olmsted landscapes in Niagara County, while the Buffalo Olmsted Parks Conservancy, a not-for-profit organization, is charged with the oversight of the Buffalo Olmsted Parks. Both groups have or are in the process of developing master plans to preserve these landscapes for their cultural and historic value, as well for their open spaces.

The above list addresses State lands only. It is emphasized that there are many other parklands and open space across the Buffalo-Niagara region that contribute to the quality of life of the area. These parks are valuable resources along the Greenway. They are depicted in Figure 2.

The region also has an extensive network of both land and water trails, which can be considered “linear parkland.” Figure 3 depicts the existing trail network through the waterfront region and connecting trail systems. Several new trail systems are in the planning and development stage, including a scenic trail between Lewiston and the City of Niagara Falls, trails in the Town of Tonawanda tying into the Riverwalk, and the Outer Harbor Trails in the City of Buffalo, which will provide waterfront access along previously inaccessible Niagara Frontier Transportation Authority (NFTA) lands. There are also numerous proposals for completing segments of trails throughout the region that are in the process of obtaining funding.

Trails can also be important connectors between the Niagara River Greenway and upland and interior communities. In particular, there are three state-designated trail systems—the Seaway Trail, the Erie Canal and the Niagara Wine Trail—that provide linkages beyond the region.

The New York State Seaway Trail is a state and nationally designated scenic by-way covering a 454-mile scenic route paralleling Lake Erie, the Niagara River, Lake Ontario and the St. Lawrence River. A well-marked, scenic alternative to interstate highways and toll roads, the Seaway Trail leads the visitor to eye-opening treasures one might otherwise overlook. A portion of the Seaway Trail parallels the Niagara River Greenway and also extends eastward along the Lake Ontario shoreline and south along the Lake Erie shore. Seaway Trail, Inc., a not-for-profit membership organization, works with local governments to promote and advocate for the Seaway Trail through educational, recreational programming, promotions and marketing, and planning efforts.
CHAPTER 2: INVENTORY

The goals of the Seaway Trail are to:
- Pursue an increased but stable rate of economic development and growth of the tourism industry throughout the Seaway Trail region,
- Protect and enhance the scenic, natural and cultural resources of the Seaway Trail region, and
- Develop the Seaway Trail region as a high quality experience for recreation and vacations.

The Erie Canal runs concurrent with the Niagara River Greenway in the Cities of Tonawanda and North Tonawanda, and extends eastward across New York State. The Erie Canal is also a federally designated national heritage corridor: Erie Canalway National Heritage Corridor. That portion of the Canal that runs through Western New York is also designated as the Western Erie Canal Heritage Corridor, part of the New York State Heritage Area System. The Erie Canal and multi-use trail represent both a water based “blueway” and land based system which connects the Niagara River Greenway by land and by water to points east. Several management plans guide projects along the Canal. Projects identified in these plans that improve the connectivity of the Canal trail and the Greenway can contribute to the implementation of the Greenway plan.

The Niagara Wine Trail is a state-designated trail that links a number of wineries and other attractions across Niagara County and into Orleans County. It overlaps the Niagara River Greenway in the western end of the Trail, extending from the City of Niagara Falls north to Lewiston. The Niagara Wine Trail continues eastward along Route 104 and some adjacent roadways to connect the wineries along the route of the Trail.

These state-designated connecting systems, which are depicted on Figure 3, link the Greenway to upland and interior communities and help integrate the Greenway into wider systems. A wealth of heritage resources and highly scenic landscapes can be found along these connections. These and similar linkages improve access to the Greenway and to the many resources and attractions of this region that fall outside the designated geographic boundary of the Niagara River Greenway.

The Greater Buffalo Niagara Regional Transportation Council (GBNRTC) is leading an effort to implement a “Shoreline Trail” system. The Shoreline Trail will run along the Lake Erie and Niagara River shorelines from the southern end of Erie County in Brant to the mouth of the Niagara River in Porter. Completion of the Niagara River section of the Shoreline Trail is also a priority for the Niagara River Greenway. More information about the existing trails, trail gaps and efforts to complete the network is included as one of the Implementation Concepts in a later section of this Plan.

There are also a number of important waterfront access sites along the length of the River. Many of these sites are associated with public parkland. Figure 4 indicates the location of water access, including boat launches, marinas and official fishing access points. There are also many locations along the length of the River and its tributaries where there are informal fishing access spots and locations where paddle powered boats such as canoes and kayaks can be launched.
CHAPTER 2: INVENTORY

B. Ecological Resources

The ecological resources of the Niagara River are clearly of critical importance to the Greenway. These resources form the foundation of the unique environmental character of the region. The inventory of ecological resources is described at length in the Generic Environmental Impact Statement section of this report (Chapter 6). In particular, the region includes many unique wetlands and NYS significant coastal fish and wildlife habitats, which are listed and described in Chapter 6. The issue is also addressed as an Implementation Concept in the Action Plan (Chapter 4), which illustrates conceptual ways of protecting, preserving and restoring important ecological resources such as uplands, riparian-floodplain areas, wetlands, aquatic habitats and impaired habitats. Figures 5 and 6 illustrate significant ecological resources including designated significant coastal fish and wildlife habitats, tributaries to the River and State and Federal wetlands.

C. Heritage Sites

The Buffalo-Niagara region has a rich history that has achieved national recognition. For example, the National Park Service has recently completed the Niagara National Heritage Area Study (2005). This study is the first step in the designation process for a National Heritage Area that would extend along the Niagara County portion of the Niagara River. There are currently only 37 National Heritage Areas or National Heritage Corridors across the United States. The final designation will require an act of Congress. Bills in support of the designation are currently before both Houses of the United States Congress. Official designation would provide national support for the development of a management plan, as well as technical and financial support for implementation of its recommendations. Efforts are underway to capitalize on this region’s rich heritage, including its architectural, industrial, and historical resources.

There are dozens of properties in the region that are listed on the National Register of Historic Places. The National Register is the nation’s official list of significant buildings, sites, properties, archeological and cultural resources. Properties on the National Register have been evaluated according to set criteria and are officially designated by the National Park Service as worthy of preservation due to their architectural, cultural and/or historic significance. Many of these historic sites are located along the Niagara River. There are also a number of historic districts, areas where there is such a concentration of historic or architecturally significant structures that the entire neighborhood is designated as historic. These sites and districts are depicted on Figure 7. In addition, there are many historic and culturally significant sites and buildings across the region that are eligible for listing in the National Register of Historic Places, but have not been officially designated. Figure 7 also depicts significant sites that have been identified in local planning documents but that are not officially on the National Register.

Old Fort Niagara

Among the sites that are listed in the National Register are over a dozen properties in Erie and Niagara Counties that are designated as a National Historic Landmark or National Historic Site. Designation as a National Historic Landmark or National Historic Site is the
highest level of historic and/or architectural significance that can be achieved, and there are fewer than 2,500 such sites in the United States and its territories. Evidence of the strong heritage of this area is the fact that the Buffalo-Niagara region has more officially designated National Historic Landmarks than some States do. All but one of these landmark sites is located within the boundary of the Niagara River Greenway.

D. Additional Lands that Contribute to the Greenway

A required element of the Niagara River Greenway Plan is the identification of additional lands that would contribute to the purposes of the Greenway through acquisition, dedication or redevelopment. The State legislation establishing the Niagara River Greenway Commission does not give the Commission the authority to own or hold real property, and the Commission can not directly acquire any lands. However, there are categories of lands that contribute to the Greenway and should be targeted for preservation, either through acquisition or other means. The Commission can facilitate such actions by bringing together parties with mutual interests.

The Niagara River Greenway Plan supports open space preservation, prioritizing significant ecological areas, areas that provide recreational opportunities, and/or promote water resource protection. It supports existing local efforts, and encourages future activities toward this goal. The Plan does not explicitly list all specific tools that can be used to encourage open space preservation in order to avoid limiting options, and to enable maximum flexibility to the local project sponsors in developing appropriate methods for achieving their open space goals.

The New York State Open Space Plan (2006) has established priorities for the types of sites that should be targeted for acquisition or dedication for open space, including sites within the Niagara River Greenway. The recommendations for each region in the Open Space Plan have been made by regional advisory committees with input from State staff, local governments and the public. Updated every three years, the New York State Open Space Plan is the most comprehensive source for this type of information and therefore, it has been used as the basis for identifying lands for conservation.

For the western New York region, the highest priorities for open space acquisition are projects that protect significant ecological areas, provide recreational opportunities and/or promote water resource protection. These include projects that protect important habitat areas, unique ecosystems, such as the escarpment, and important resources, such as old growth forests. Lands along the Niagara River are explicitly included as a priority. Potential stewards of open space include the State, local governments, counties, school districts, public benefit corporations, environmental groups, such as the Western New York Land Conservancy, or private owners who agree to institute conservation easements, deed restrictions or other long-term methods of ensuring the resource’s preservation.

Source: NYS 2005 Open Space Conservation Plan (Draft), November 2005

In addition to conservation of lands for environmental purposes, this Plan supports the reuse of brownfield sites and redevelopment of vacant or underutilized properties within the existing urban centers, neighborhood business districts and downtown “Main Streets” areas adjacent to the Niagara River. Rebuilding within already developed areas will help local economies and help to relieve development pressures on open spaces.

### E. Existing Plans and Plans under Development

In recent years, there has been a great deal of planning activity in the communities along the Niagara River. These plans have helped establish community visions for waterfront lands and broader municipal areas. All of the local governments that front the Niagara River have undertaken some level of planning for their waterfront, either through developing Local Waterfront Revitalization Programs, local Comprehensive Plans, greenspace plans and/or strategic plans. As illustrated in the following table, seven of the eleven municipalities fronting the Niagara River have prepared Local Waterfront Revitalization Programs (LWRPs) pursuant to Article 42 of the NYS Executive Laws. This list includes the Town of Grand Island, whose LWRP was approved by New York State in December 2006. While the City of Niagara Falls does not have an LWRP, it has completed a waterfront plan. The Town of Niagara and the Village of Kenmore do not have waterfront lands.

LWRPs seek a balance of economic development and natural resource protection and are, therefore, important mechanisms for communities to use in implementing the Niagara River Greenway Plan. An important feature of a LWRP is that once adopted, state and federal actions must make an effort to comply with the LWRP. In partnership with the Department of State, Division of Coastal Resources, all Niagara River Greenway communities are encouraged to prepare a Local Program. Existing LWRPs should be amended to incorporate the Niagara River Greenway.
CHAPTER 2: INVENTORY

Several communities have committees charged with waterfront planning, and a number of municipalities are actively implementing projects, plans and programs set forth in their planning documents. The following table summarizes the status of planning efforts for the communities along the Niagara River.

In addition to the planning efforts being undertaken by the local jurisdictions with direct control over land use and zoning, there have been a number of regionally based or intermunicipal planning efforts, where cooperative partnerships across municipal lines have begun to occur. These documents also provided valuable insight into the potential for the Niagara River Greenway to help coordinate activities and serve as an organizational framework for planning activities. The following list summarizes the major regional and intermunicipal reports and studies that have been conducted in the region.

Several communities are working on implementing the recommendations and actions developed in their planning documents. The Town of Porter is developing new zoning regulations to further the vision set forth in their recently adopted Comprehensive Plan. The Cities of Niagara Falls and Buffalo have a number of initiatives underway designed to help accomplish the goals set forth in their plans. These include brownfields studies, transportation studies, neighborhood plans and area strategic plans, as well as specific project-based planning efforts. Nearly all of the communities within the Niagara River Greenway area have identified specific action items that they want to see accomplished, and many have begun to take steps to achieve those projects and activities. The Niagara River Greenway Commission has received lists of projects and concepts from municipalities and various interest groups, stakeholders and membership groups across the region. These proposals are summarized in Chapter 5 of this report.
CHAPTER 3: VISION AND PRINCIPLES

3.0 VISION AND PRINCIPLES

A. Vision for the Niagara River Greenway

The Niagara River Greenway is a special place, encompassing significant natural, cultural, recreational, scenic and heritage resources. It is also a way of integrating the ideas and stories that bring the Niagara River corridor to life and reveal this region’s interdependence, its place in history and its connections to the natural and built environment. The Niagara River Greenway is also a planning framework. It represents a tangible initiative that various constituents, organizations and municipalities can organize around, advancing local and regional agendas for community livability, environmental sustainability, and economic revitalization. The general support for the concept of the Greenway can help overcome rivalries and encourage greater cooperation and opportunities for partnerships. For this planning framework to work effectively, it must be built on a consistent vision for the Niagara River Greenway.

There is consensus about the importance and value of the Niagara River corridor. From local governments to various grassroots organizations, there is a long history of grassroots planning related to waterfront and greenway issues. These efforts have been focused around specific issues, such as watershed protection, environmental preservation, trails planning, neighborhood revitalization, and brownfield redevelopment. Numerous non-profits and other stakeholder organizations have worked hard on improving a wide range of specific assets along the greenway, such as heritage sites, parks, creeks, waterfront access, habitats, and more. As the active public participation evidenced throughout this process has shown, there are many individuals, municipal leaders and organizations who are passionate about various aspects of the Niagara River Greenway, and who care deeply about its future.

This long history of planning, the diversity of groups working to achieve a better quality of life in the communities along the River, and the advocacy that has occurred throughout this effort all underscore the broad support and appeal of the Greenway. While there has been debate over specific issues, there has consistently been support for the concept of a Niagara River Greenway that seeks to preserve, enhance, integrate and promote those elements of the River corridor that help make this a special place. Building upon that support, the Commission has adopted the following Vision Statement for the Niagara River Greenway:

Niagara River Greenway Vision Statement

*The Niagara River Greenway is a world-class corridor of places, parks and landscapes that celebrate and interpret our unique natural, cultural, recreational, scenic and heritage resources and provide access to and connections between these important resources while giving rise to economic opportunities for the region.*
CHAPTER 3: VISION AND PRINCIPLES

Several points in this Vision Statement merit emphasizing.

**The Niagara River Greenway is world-class.**

Niagara Falls, the centerpiece of the Greenway, is one of the great natural wonders of the world. To quote from the National Parks Service, “At Niagara we encounter a natural phenomenon that is overwhelming in its magnitude and deeply embedded in popular consciousness.” In addition to the world-class importance of the Falls, the Niagara River Greenway also includes internationally significant birding areas, unique ecosystems, and world-class architecture. The development of the Greenway presents opportunities to add to this list of world-class features, with new activities and projects of equal caliber.

**The Niagara River Greenway is a corridor.**

The River, the Greenway and its resources extend as a linear corridor from Lake Erie to Lake Ontario. Although the jurisdictional boundary of the Greenway is based on municipal lines, the heart of the Greenway and the focus of most activities will fall within the area nearest the water.

**The elements of the Niagara River Greenway that make it special include its places, parks and landscapes.**

Many landscapes create the corridor, including open spaces and conservation areas, parks and recreational sites, working industrial lands and now-vacant brownfields, cities and residential neighborhoods. These places and their diversity contribute to the experience of the Greenway.

**The Niagara River Greenway is a place to celebrate and interpret shared resources.**

The many unique ecosystems and environmental features merit both protection and greater appreciation. The Greenway is dotted with dozens of cultural attractions and venues, and a myriad of events enliven the corridor and contribute to the experience of the Greenway. There are vast recreational opportunities on both land and water, ranging from active pursuits to passive enjoyment of the landscape. The Greenway can make these more accessible. The Greenway contains a diversity of sceneries that tend to get taken for granted, but which stun visitors with their quality. The history and heritage of this region runs deep, touching every aspect of the American experience from the rich history of the Native Americans who first lived along the shores of the River to the modern day. The Greenway is a physical place where people can experience and obtain a greater understanding of these rich resources. The Niagara River Greenway presents an opportunity to contribute to the economy of the region by promoting economic and tourism opportunities that capitalize on the region’s rich inventory of ecological, heritage, recreational and cultural resources.

**The Niagara River Greenway will serve as a circulation system for the region that will improve access and connections throughout the area.**

The Greenway will physically connect parks, recreation, waterfront sites and other resources to each other and to the surrounding areas, through trails, interpretive signage, gateways, overlooks and other linkages. It will also create emotional and experiential connections. The Greenway, as a conceptual framework, will knit the diverse elements of the region into a more coherent whole.
B. Overview of Public Participation Efforts

Preparation of the Niagara River Greenway Plan has provided meaningful opportunities for local leaders, stakeholders, and the general public to provide ideas and insights into the development of the plan. Outreach has been extensive and diversified, using a variety of techniques and forums for disseminating information and soliciting input. Information about the Greenway and dialogue with the various stakeholder groups even precedes this current plan, having been initiated in relation to the New York Power Authority relicensing efforts, when numerous interviews and meetings were held with representatives of governments, agencies, environmental groups, non-profits and other interests.

Public Meeting for the Greenway Plan

The public participation element for the project has included workshops, stakeholder meetings, website postings, brochures, interviews and public meetings. Particularly in Niagara County, the local press has provided consistent attention to the project. Public input has also been structured into the design of the Niagara River Greenway Commission. All meetings of the Commission have been open to the public, with advance notice provided to the media.

The legislation establishing the Niagara River Greenway Commission set up two subcommittees, which have met regularly for the express purpose of communicating progress and obtaining feedback on the planning effort. The Local Government Advisory Committee provides an avenue of communication with the local government leaders who will be responsible for adopting the plan. The Citizen Advisory Committee provides the opportunity for various stakeholder groups and members of the general public to be informed of progress being made, and offer any comments or concerns they may have. Both forums have also been used by participants to recommend specific projects and concepts for inclusion in the Niagara River Greenway Plan.

A summary of public participation is included in Appendix B.

C. Principles for the Niagara River Greenway

The principles for the Niagara River Greenway represent the general values that will guide greenway planning into the future. These basic principles have been presented and discussed in various venues, and have received broad general support on the part of the wide range of groups that have been actively involved in the development of the Greenway Plan.

The focus of these principles is to facilitate the implementation of the vision established for the Niagara River Greenway. They promote high-quality, ecologically sensitive and sustainable activities and development. All actions within the Niagara River Greenway should be evaluated against these principles, not only to assess their validity, but to help improve the quality of efforts that move forward.
CHAPTER 3: VISION AND PRINCIPLES

The guiding principles for the development of the Niagara River Greenway are:

- **Excellence** – Existing Greenway resources are globally significant and Greenway projects will meet world class standards.
- **Sustainability** – The Greenway will be designed to promote ecological, economic and physical sustainability for long-term viability and effectiveness.
- **Accessibility** – The Greenway will be designed to provide and increase physical and visual access to and from the waterfront and related resources for a full range of users (youth, seniors, persons with special needs).
- **Ecological Integrity** – The Greenway will be focused on maintaining and improving the health, vitality and integrity of natural resources and wildlife habitats. Emphasis will be placed on restoring and retaining ecologically significant areas and natural landscapes, both in and over the water and upland.
- **Public Well-Being** – The Greenway will be designed to achieve and promote physical and emotional wellness through the experience that it offers to the public. Availability of both land- and water-based recreational facilities, and access to both active and passive recreational opportunities should be considered in the development of Greenway assets.
- **Connectivity** – The Greenway will increase connectivity and access (trails, pathways, parks, water access), promote the continuity of open space and habitats, and provide for connections to related corridors and resources across the region, including connections across the international border with Canada.
- **Restoration** – The Greenway will be designed to encourage the restoration of ecological resources, the appropriate reuse of brownfields, and the revitalization of existing urban centers along the corridor.
- **Authenticity** – The Greenway will establish a clear sense of “place” and identity that reflects the traditional spirit and heritage of the area. Projects and activities should have a connection to the character, culture and/or history of their location.
- **Celebration** – The Greenway will be designed to celebrate local history, diversity, cultural resources, and the natural and built environments, and will seek to share this diverse tradition with local residents and visitors to the region. Projects that support education, interpretation are encouraged, as are events and activities that help build social interaction and shared experiences.
- **Partnerships** – The focus of the Greenway will revolve around cooperation and reciprocal compromise. Relationships and partnerships must be formed and strengthened to achieve coordination and integration of efforts throughout the Greenway.
- **Community Based** – Greenway planning will reflect the preferences and plans of the local communities, while respecting other stated goals and the communal vision of the Niagara River Greenway.

The above principles present a guide to actions and development within the Niagara River Greenway over the long-term, so that the cumulative effect of projects is to move toward achieving the shared vision for the Niagara River Greenway. The principles are applicable to municipalities without waterfront lands as well as those fronting the River. They promote access and connections, including trail linkages. They support high quality, ecologically-sound projects throughout the region. They are fundamental enough to remain relevant over changing circumstances, providing consistency with flexibility. However, they are also necessarily abstract. The following section describes the goals that have been developed to help operationalize these principles.
CHAPTER 3: VISION AND PRINCIPLES

D. Greenway Goals

The planning process for this effort revealed a number of concepts that represent what is seen as the core of the Niagara River Greenway. These benchmark concepts are important to achieve in order to realize the full potential of the Niagara River Greenway. They are articulated here as goals. They form the basis for the priorities articulated in the next Chapter, and were the inspiration for the Implementation Concepts. These goals are very interrelated, with considerable overlap between them. The goals will achieve an improved quality of life for area residents and an enhanced visitor experience.

These goals represent the primary goals that need to be accomplished at the outset of this process in order to fulfill the vision for the Niagara River Greenway. As the Greenway develops, additional goals will emerge that build upon this foundation, but the core goals identified here are the initial focus. The Niagara River Greenway Commission has limited resources, in terms of funds, staff or other resources, and cannot undertake an ambitious agenda of items. The Commission’s most effective position is to take a leadership role, and set the general direction for the hundreds of collective actions undertaken by a variety of public sector and private sector entities that will incrementally help create the Greenway. Therefore, these goals are simple and limited in number, to maximize their near-term impact.

Improve Access

Residents during the public participation process made it clear that they value the assets of the Greenway, and welcome better opportunities to be able to enjoy these resources. Establishing a multi-use trail network across the Greenway is one way to enhance access. Gateways welcome visitors to the Greenway and promote access. There is support for increased opportunities for water-side access, including “blue line,” or water-based trails. Scenic overlooks, interpretive centers, signage and wayfinding systems also help promote access, by making it easier to navigate the Greenway. The Niagara River Greenway will facilitate ways for people to take advantage of the full range of resources and activities along the River.

Make Connections

Most fundamentally, the Greenway is a means to forge better connections across the region. These connections include physical connections that link destinations and communities, and the development of a multi-use trail along the length of the River is a primary goal of the Greenway. Connections also include conceptual linkages: how do people understand the Greenway? How do they navigate through the Greenway? How do they understand the
connections between the people, the history and the environment of the region?

The Greenway is a communal concept that stretches across two counties and over thirteen municipalities. The Greenway will promote improved physical connections between the many assets of the Greenway. It will promote improved coordination among the many partners that make up the Niagara River Greenway, and the Greenway will foster the greater integration of the stories, resources and features that make up the Niagara River Greenway.

Strawberry Island

*Protect and Restore Environmental Systems*

There is a strong sense of stewardship for the ecological and environmental features of the Greenway. Restoring the environmental health of the region is seen both as an important goal and a critical input into the success of the Greenway. There is passionate support for a Greenway that protects and restores the region’s environmental systems, which is a necessary step for the future revitalization of the region’s economic health. There is also strong interest in providing interpretive opportunities to increase public awareness of the value of these resources, and build a greater constituency for regional environmental assets. The Niagara River Greenway will protect and restore the environmental resources of the region through habitat restoration, reclamation of damaged areas such as brownfields, and preservation of unique and threatened ecological resources. The Niagara River Greenway Commission will encourage interpretive opportunities to inform the general public about environmental resources and their importance.

Statue of Tesla, Niagara Falls

*Celebrate History and Heritage*

There is great excitement for a Greenway that helps the region celebrate and share its history with the world. In public outreach meetings, sessions of “Telling the Story” elicited the greatest participation and enthusiasm. There are literally hundreds of stories about this region, ranging from those of national importance, to the lesser known and personal stories of individuals who lived in the region. The Niagara National Heritage Area Study has outlined many of these stories, which help create a shared identity and pride for the Greenway and help connect its people, local residents and visitors alike, to the region. Additional stories from the Erie County portion of the Greenway follow similar themes. The Niagara River Greenway will increase opportunities for celebrating the area’s rich history. The Greenway will form a thematic framework for interpretation and improve coordination of interpretive activities.
CHAPTER 3: VISION AND PRINCIPLES

Spark Revitalization and Renewal
There is an understanding that the Greenway can help spark revitalization, reinvestment and renewal in the cities and communities along the corridor through sustainable development, tourism and improved quality of life factors. Reuse of brownfields and support of downtown “Main Street” development is also a goal. Economic revitalization as an activity is not the focus; rather, it is the result of good planning and an emphasis on the other features of the Greenway. In the 21st century economy, the livability of a place, including the natural environment, the built environment, the culture and recreational offerings all contribute to attracting residents, visitors and investment. Economic prosperity will be the natural outcome of making the types of improvements that further the other goals of the Greenway.

Promote Long Term Sustainability
While the focus in planning is often on new facilities and projects, there are many existing resources and assets that comprise the Niagara River Greenway. In order to strive for excellence, these resources will require care and maintenance to ensure that they remain functional and attractive assets into the future. The Niagara River Greenway will promote the long-term sustainability of existing sites and features through continued investment in regional assets, and rehabilitation and improvement of aging facilities.

Extend Olmsted’s Legacy
Frederick Law Olmsted was instrumental in saving Niagara Falls and portions of the Niagara River corridor from over-development at a time when commercial and industrial development threatened the integrity of the landscape. Olmsted’s vision for the Niagara River corridor was truly revolutionary and it established a legacy that is important to maintain and enhance. Olmsted’s vision extended beyond the “Niagara Reservation.” He envisioned a necklace of parks and open spaces along the length of the River, from Front Park in the City of Buffalo and stretching north of the Falls. Olmsted’s design for the Buffalo Park system included open spaces and connecting parkways that provided access to greenery at a municipal scale. The Niagara River Greenway will integrate open space and connections to provide access to a diversity of resources at a regional scale. Efforts undertaken under the leadership of the Niagara River Greenway Commission will preserve Olmsted’s vision, building a legacy for future generations.
CHAPTER 4: ACTION PLAN

4.0 ACTION PLAN

The Action Plan represents the recommendations and implementation concepts for the Niagara River Greenway Plan. It establishes a methodology for realizing the vision outlined in the previous chapter. Implementing the Greenway is a massive undertaking that will take the cooperative efforts of a wide range of groups and people. The Vision, the Principles and the Goals will set the compass in the right direction, but it will take hundreds of incremental steps and individual actions to make the Niagara River Greenway a reality. The Action Plan sets forth the framework to guide collective decision-making for the Greenway, so that all stakeholders will have a sense of how their specific actions contribute to the whole. It will guide planning efforts of local and State agencies throughout the Greenway, and form the basis for moving toward a consistent vision.

A. Criteria:

The Niagara River Greenway will be comprised of many individual actions, under the sponsorship of various municipalities, non-profit groups, neighborhood organizations, cultural institutions and others. Many of these actions will be site specific projects. Others will constitute system-wide improvements, such as signage; while another category of projects will include programming, such as the use of “Greenway Guides” and the scheduling of special events. This plan must set clear criteria for the evaluation of these activities, not only so the Commission can determine whether an action is consistent with the Plan, but also to help guide and inform project development.

This section of the report addresses criteria for evaluating and forming projects and activities proposed within the Greenway. It also identifies potential funding sources; strategies for operations and maintenance; key partnerships and potential linkages. It addresses system-wide transportation issues that will have an impact on the Greenway, as well as a series of Implementation Concepts that illustrate system-wide recommendations. It concludes with a summary section that illustrates the Vision for the Greenway in graphic terms.

Criteria

1. Consistency with Principles
2. Priority Status
3. Focus Area
4. Environmental Soundness
5. Implementable
6. Economic Viability
7. Local Sponsor or Partner
8. Matching Funds/ Leveraging
9. Consideration of other Planning Efforts
10. Clear Benefits
CHAPTER 4: ACTION PLAN

establish a standard. In this sense, the criteria can be used to help improve the quality of projects and activities throughout the Greenway.

For example, these standards can be applied by municipal planning boards to assess private sector development within the Greenway, and make recommendations regarding potential revisions the sponsor could adopt to improve how the project integrates into the Greenway. These adaptations would be entirely voluntary, but it has been shown that quality of life factors, such as proximity to trails, access to recreational amenities and availability of cultural activities are becoming significant marketing factors for both commercial and residential private development.

Isleview Park, Tonawanda

These standards can also be used to evaluate projects being forwarded for grant funding, whether through the Relicensing Greenway Settlement funds or through other funding sources. In regard to the Settlement Funds, the Niagara River Greenway Commission does not have control over which projects will be funded, which falls under the jurisdiction of the Standing Committees created as part of the contractual agreements with the New York Power Authority. (See Appendix C). While the Standing Committees have the sole responsibility for selecting projects to be funded in whole or in part, project applicants must provide documentation evidencing consultation with the Niagara River Greenway Commission. The following criteria can be used to facilitate this consultation. Projects do not need to meet all 10 criteria, and all proposed projects would be evaluated based on the totality of the project. It is possible that in the future, other potential funding agencies will adopt these standards as a means to evaluate projects forwarded for funding within the Greenway.

The criteria, which were built from previous planning efforts and extensive public input, are intended to provide stronger guidance for project sponsors as to the types of projects that would help promote the Greenway. The Niagara River Greenway Commission will not itself undertake any projects, and no projects will be evaluated except upon request by a project sponsor.

1. **Consistency with Principles**

The most basic consideration is whether a proposal is consistent with the Principles that have been established for the Niagara River Greenway (see Chapter 3). While there is clearly a quantitative element of consistency in terms of the number of principles that are met by a particular proposal, there is also an equally important qualitative element. A project that makes a significant contribution toward one or two specific principles may be preferred over a project that is simply consistent with a number of principles. Although this determination is inherently subjective, it provides a baseline assessment that encourages vision for the Greenway to be explicitly considered in project development.
CHAPTER 4: ACTION PLAN

2. **Priority Status**
   As noted previously, a number of concepts consistently emerged during the public input process as key elements of a Niagara River Greenway. These concepts, articulated as goals in Chapter 3, form the basis of initial priorities for the Greenway Commission. These goals highlight the activities that will advance the Niagara River Greenway over the next decade. The priorities listed here have been developed to ensure proposed activities will take positive steps toward implementing the Greenway goals. As progress is made in achieving this initial list of priorities, there will be revisions and additions to the substantive priority list. Initial priorities for the Greenway are as follows:

- **Improved access to waterfront resources**
  For many years, the Buffalo-Niagara region has neglected its waterfront. Historically, heavy industry, transportation and the infrastructure necessary to support these uses have been sited along the waterfront. As a result, opportunities for public access to the water were limited and those that were available were compromised in overall quality.

  - **Black Rock Canal-Squaw Island**
    The decline of heavy industry and shipping has opened new possibilities for redevelopment. Municipalities and their residents are now beginning to take full advantage of the waterfront for its recreational, scenic and aesthetic uses. Waterfront redevelopment is also an integral feature of the revitalization of the urban centers of this region, which were built from the water’s edge out.

- **Development of an integrated trail and park system**
  One of the highest priorities for the Niagara River Greenway is the completion of an integrated trail system throughout the Greenway. This trail system will be a regional asset for residents and potentially increase tourism in the region. The central
spine of this trail system will be a “Lake to Lake” Trail extending along the River from Lake Erie to Lake Ontario. The Implementation Project on Accessing and Experiencing the River illustrates its potential alignment. A system of spurs and loops extending from the Greenway spine will connect into residential neighborhoods and provide access to near-by attractions, parks or connecting trail systems, such as the Erie Canalway. A parallel system of water-based trails will enhance opportunities for paddlesports and increase the number of ways to enjoy the River. Elements of this trail system are already in place, although certain segments are in need of rehabilitation or other improvements.

An integrated trail and park system will improve local access to the River, increase recreational opportunity and foster a greater appreciation for the natural resources throughout the Greenway. It will also encourage healthy and environmentally friendly transportation alternatives. As trails advocates have shown, the trail system will likely result in economic development benefits ranging from improved housing sales, increased real estate values, increased tourism, and quality of life factors that can be used as recruitment tools for business investment and the attraction of top quality talent to support these investments. With the growing popularity of eco-tourism, an integrated system of land- and water-based trails and parks can have strong economic benefits in addition to the intrinsic value for recreation and access.

Creation of an integrated trail and park system must also look at the condition of the existing trail system. There are areas where the existing trail is not well maintained, well-designed, appropriately aligned or user-friendly. It is a priority to rehabilitate and improve the existing trails to ensure consistently high standards throughout the trail system.

- **Restoration of Niagara River Ecosystem**

  To realize the full potential of the Niagara River Greenway, the Greenway needs to be an attractive, healthy and appealing corridor. Projects that preserve or restore natural habitats, remediate past environmental damage, and/or encourage revitalization and reuse of brownfield sites should receive priority consideration.

  In terms of ecosystems, priorities include restoration, enhancement, improved water quality, healthy habitats, improved access, control of invasive species, reintroduction of indigenous species and bio-diversity.

  Wherever feasible, there should be public ownership and stewardship of critically sensitive lands. Projects designed to promote stewardship for or awareness of the unique environmental features of the River and its natural resources (shoreline, gorge, islands, rapids, tributaries) are also valuable.
CHAPTER 4: ACTION PLAN

Concept Plan for Proposed Cherry Farm Park

Emphasis should be placed on the following:

- **Degraded Natural Shorelines:** focus on erosion protection projects that will restore natural values with the highest priority given to projects that employ state of the art bio-engineering techniques. Projects that reverse the adverse impacts of armored or hard shoreline edges and restore natural conditions are encouraged.

- **Gorge:** restoration of the geological integrity of the gorge environment including groundwater resources and the replanting of native indigenous species that were known to exist historically within the river gorge.

- **Wetlands:** restore, enhance or reestablish wetlands including urban wetlands along the main river corridor, associated islands and the principal tributaries to the Niagara River. Priority will be given to projects that restore lost ecosystem functions and values and contribute to the overall quality of the Niagara River ecosystem.

- **Buffers:** establish vegetated buffer zones along tributary stream corridors and the Niagara River shoreline to protect water quality and enhance riparian habitat values; discourage development in these sensitive areas and encourage the use of set backs to preserve habitat values.

- **Brownfields:** prioritize projects that will yield environmental improvements and beneficial end uses that foster the goals of the Niagara River Greenway.

- **Interpretation and education about the region’s cultural, natural and historic resources**
  
  Interpretation and education helps the public understand and appreciate the value of the variety of resources along the Greenway. Interpretive signage, programming, brochures, websites, Greenway “guides,” events, and other interpretive opportunities help enrich people’s experience of the Greenway.

Interpretive Signage in Youngstown

They can also help underscore themes and relationships that personalize the experience and make it easier to understand. Using interpretive themes can also help with packaging and marketing of the Greenway to highlight connections between sites that are not immediately obvious. Interpretive and educational projects can also build an appreciation of the value of the ecological resources of the region.

- **Revitalization of Urban Centers**
  
  In terms of urban centers, revitalization of traditional downtown centers and promotion of vital neighborhoods will improve the character of the area, promote tourism, curtail sprawl and improve the overall quality of life. Redevelopment in appropriate locations will help alleviate development pressures on natural sites. It is a priority to promote greater activity in traditional downtowns, in neighborhood centers and on brownfield sites.
CHAPTER 4: ACTION PLAN

Redevelopment should avoid important open space areas within urban centers that are often the only natural areas available to urban populations and which serve important environmental functions. Such areas include but are not limited to major urban wetlands, such as Tifft Nature Preserve and corridors of open space, such as those following the Buffalo River.

3. Focus Area

The boundaries of the Greenway have been mapped along municipal boundaries. However, projects close to the River and its immediately adjacent assets should be elevated. Progress on improving this core area will create discrete, visible results that will have a local, regional and even international impact. As activities in the core area are completed, this momentum can then be shifted to areas that link to the greenway or further enhance its definition. Projects within the focus area, as shown in Figure 8, are elevated.

Environmental soundness should be incorporated into project design for built projects. Energy-efficiency and other “green” design features should be encouraged. Projects that involve a higher density or intensity of use should be encouraged to locate in existing developed areas, reinvesting in the region’s urban centers and revitalizing underutilized areas. Projects on waterfront lands should be water-dependent or water-enhanced uses, as defined under the Coastal Zone Management program. The sustainability of the project should also be considered, encouraging use of products that reduce other stakeholders will develop projects consistent with the Greenway plan, but not necessarily along the River’s edge. Projects away from the River should help establish physical and/or interpretive connections between the River and the surrounding area.

4. Environmental Soundness

The intent of this criterion is to encourage activities to consider environmental soundness in their design and implementation. Projects should strive to enhance the environmental quality of the region. This does not mean that all projects must have an environmental focus, but all projects should undertake a serious evaluation of potential impacts associated with the development, and take a creative approach to how any negative impacts can be reduced or removed.
operations or maintenance costs. Project sponsors should avoid projects which result in the disturbance, modification or permanent destruction of Greenway resources that serve the needs of the public interest.

5. **Implementable**

Projects need to be clearly thought-out. Sponsors need to identify the specific actions and steps necessary to complete their proposed projects. Proposals should include a schedule and a realistic assessment of the expected costs associated with the project. This analysis needs to include an assessment of not only capital costs, but also the costs of management, operations and maintenance that can be reasonably expected to occur over the life of the project. The prospective project sponsor must show evidence of having researched the types of permits and regulatory approvals that will be needed to bring the project to fruition, and what strategies and steps will be required to move the proposed project through the various regulatory approval processes. There should be general public support for the project. Public support can be shown through municipal resolutions, public record or correspondence.

Many projects will be too large to accomplish in one step. For these projects, there should be a logical phasing plan. Where feasible, the project should be broken into discrete, coherent “sub-projects,” with each sub-project having independent value and benefit. In the case of a trail project, each sub-section should be a logical length, with termini at reasonable locations. However, phasing shall not be used for the sole purpose of expediting the review of smaller components of a larger discrete project. The level of detail should be commensurate with the level of project consideration. Projects that are at an early conceptual or planning stage will not have specific, firm dates and costs, whereas projects moving toward construction need to provide greater documentation and justification of the estimates.

6. **Economic Viability**

As a corollary to the concept of “implementable,” each project should have a realistic assessment of anticipated economic viability. The intent of this criterion is to ensure that project sponsors have considered projects’ on-going operation and maintenance costs, as is required under the legislation. The level of effort should be appropriate to the proposed plan, with less information needed for a project, such as a trail, that has more limited operations and maintenance costs than would typically occur for a more ambitious project with potentially long-term costs for personnel, utilities, marketing, and overall management. Projects should be encouraged to incorporate sustainability by using such options as energy-efficient design that will demonstrate a green approach to resource conservation and will reduce on-going operational costs. The economic viability assessment should identify potential revenue streams that will cover expected project costs. If the project has a municipal sponsor, it may be possible to substitute in-kind services consisting of items such as labor, materials or technical services for cash support. If cash support is proposed, the source of funding should be identified.

Projects will not be required to demonstrate economic impacts, and the Niagara River Greenway Commission will not require economic feasibility analyses from project sponsors. However, project sponsors should identify dedicated funding sources, whether through a municipal budget or other source, to cover any on-going shortfalls. Projects that are not self sustaining will become a drain on the region, and will not help advance the purposes of the Niagara River Greenway.
CHAPTER 4: ACTION PLAN

7. **Local Sponsor or Partner**

The Niagara River Greenway must meet a level of quality that enhances the region. Therefore, projects need a sponsor that will assume the long-term responsibility for continued operation and maintenance. A trail that falls into disrepair is not an asset to the region and a facility or project that cannot meet operational cost obligations will not be sustainable. There should be a preference for projects that have a sponsor or partner that will continue to champion the project after it is completed.

LaSalle Pride/ Buffalo Niagara Riverkeeper

The role of the sponsor is to oversee the long-term viability of the project: continued funding needs, operations and maintenance efforts, oversight of management and condition, stewardship into the future. A municipal sponsor is preferred for a number of reasons: municipalities have the institutional capacity to ensure long-term oversight for a project. They have clear sources of revenues, through their taxing authority. They have personnel who can take on responsibility for oversight, maintenance and other functions. Municipalities generally have the capacity to make provisions for public safety and security. Municipal leaders also have the visibility and stature to build support and provide advocacy. Other forms of sponsorship or partnerships are feasible. Non-profits, volunteer groups, or “friends” groups that possess the necessary fiscal and organizational capability can also sponsor projects. Each case must be considered on its merits, but the stronger the capacity of the sponsor, the more likely the project will be successful.

Research has demonstrated that the most successful Greenways are those that are able to establish strong partnerships. Where it makes sense, joint sponsors are encouraged, to provide more than one supporter, and to help build a wider base of support. Joint sponsorship also facilitates intermunicipal or system-wide projects, such as trails. While the development of partnerships is encouraged, roles should be clearly defined.

8. **Matching Funds/ Leveraging**

The projects and activities that can be undertaken under the Niagara River Greenway umbrella vastly exceed the amount of resources that will be available. The region is fortunate to have a dedicated funding source, through the NYPA Relicensing Agreement funds, to help achieve the purpose of the Greenway. The various Greenway funds total approximately $9 million per year for the 50-year term of their license (see Appendix C), for a net present value of an estimated $145.7 million. While these funds represent a significant investment, they are insufficient to fund all of the worthwhile programs, proposals and projects that have been and will continue to be forwarded. Municipalities and other sponsors will need to look to other sources in addition to NYPA Greenway funds to fully realize the vision for the Greenway. Potential funding sources are discussed later in this chapter.

The Niagara River Greenway Commission has no direct role in allocating funding for projects within the Greenway and cannot set specific funding limits or matching fund requirements. However, it is good policy to try to leverage the funds dedicated to Greenway purposes to the maximum amount possible. Dedicated Greenway funds should
be seen as seed money, employed as “gap” financing, used to leverage other investments, or to match grants obtained from other sources (See Appendix D). They should not be used to substitute for existing funding sources.

9. Consideration of other Planning Efforts
There has been a great deal of effort and thought put into various plans for each of the municipalities along the Niagara River Greenway corridor, as well as many planning efforts that cross municipal boundaries. These range from Local Waterfront Revitalization Programs (LWRPs) that focus on local waterfronts, to municipal comprehensive plans, to the two federally sponsored heritage area studies: the Niagara National Heritage Area Study and the Erie Canalway National Heritage Corridor. Local Waterfront Revitalization Programs (LWRPs) seek a balance of economic development and natural resource protection and are, therefore, important mechanisms for communities to use in implementing the Niagara River Greenway Plan. An important feature of a LWRP is that once adopted, state and federal actions must make an effort to comply with the LWRP. In partnership with the Department of State, Division of Coastal Resources, all Niagara River Greenway communities are encouraged to prepare a Local Program. Existing LWRPs should be amended to incorporate the Niagara River Greenway. Topic specific studies, including those dealing with stormwater management, remedial action plans, brownfields studies, heritage tourism and other plans should also be taken into consideration. Proposals for projects should be built upon the work that has been completed, and be consistent with local goals, values and vision, while meeting best practices and models set forth in federal, state and regional documents, including advances in new technology.

10. Clear Benefits
All projects that are endorsed by the Niagara River Greenway Commission should demonstrate clear benefits to the Niagara River, the Niagara River Greenway and the stated vision of the Greenway as a world-class corridor. The intent of this criterion is to ensure project sponsors think about how to structure their proposals to maximize the beneficial impacts to the environment, to the economy and to the region. Projects that fall outside the Greenway boundary need to make a more compelling case for how they benefit the purposes of the Greenway. Priority should be given to a project that fills a critical gap, improves a highly visible site, results in significant improvement in environmental conditions, or has some other significant positive benefits.

B. Funding Sources
The Niagara River Greenway is unusual, in that there is a dedicated funding source for the effort that preceded its legislative establishment. The Niagara River Greenway Commission recognizes that several interests have secured Greenway related settlement dollars in relation to the re-licensing of the Niagara Power Project. In particular, the Commission recognizes, acknowledges and congratulates the Niagara Host Communities, the Erie County Settlement Partners, the Greenway Ecological Standing Committee and the State Office of Parks, Recreation and Historic Preservation on their agreements with the New York Power Authority. The
CHAPTER 4: ACTION PLAN

Greenway Commission looks forward to working within the process outlined in those settlement agreements and anticipates consulting on all projects as required by those agreements.

The NYPA Greenway funds are a significant and important source of funding for the Greenway. As noted earlier in this document, however, the NYPA funds will be insufficient to fund all the worthwhile projects that are known or may be proposed in the future.

*Additional sources of funding will be necessary to fully realize the vision of the Niagara River Greenway.*

This point merits emphasis. Other potential sources of funds for Greenway-related activities include federal, state, and local funds, as well as private sources, such as foundations. There are a variety of grant programs available from other New York State and federal agencies to assist local governments, community groups, and other organizations achieve important environmental protection and community revitalization goals. These programs encompass a wide range of priority issues including natural resource preservation and restoration, water quality protection and pollution prevention, historic preservation and interpretation, community revitalization, land acquisition and open space protection, and greenway and trail development. Appendix D provides an extensive discussion of additional potential sources for projects associated with the Niagara River Greenway.

C. Operations and Maintenance

Implementing and sustaining Greenway-related projects will entail one-time construction and implementation costs as well as annually recurring operational and maintenance (O&M) costs. The term O&M refers to the day-to-day upkeep as well as the smooth and safe functioning of the greenway project. These tangible O&M costs will be offset by economic benefits derived from the Greenway and associated development and by increased quality of life for residents and visitors to the region.

Since the proposed Greenway-related projects are only conceptual in nature at this point, it is difficult to perform a detailed analysis of the annualized O&M costs.

In place of an analysis using actual O&M costs, a “level-of-magnitude” analysis is provided to measure typical recurring costs that would be expected to occur as a result of implementation of the demonstration concepts. When actual projects are identified and reviewed, a more detailed analysis on the O&M costs should be required. The analysis provided here is for informational purposes, and each project sponsor is responsible to make their best estimate of the on-going O&M costs of their projects.

The following discussion of O & M costs is organized around the implementation concepts as identified and discussed separately in this Plan. Given the wide range of potential projects that could be funded under the Niagara River Greenway Plan, even under each implementation concept, basic examples will be discussed.
Implementation Concept #1 – Gateway Identification

The overall operation and maintenance costs associated with the gateway identification concept will be relatively small. This concept primarily ensures that a unifying theme is used throughout the Greenway. Once the initial design phase is completed, relatively little costs will be required to continue the use of the planned color schemes, graphics, and signage. Similarly, the design and use of a unifying architectural treatment, landscapes and plantings will also have limited long-term costs.

If, however, landscape and horticultural projects are included under this concept, additional O & M costs will be required to maintain these areas. While these costs are not anticipated to significant, they would need to be evaluated on a project-specific basis.

According to the 2006 budgets for Erie and Niagara Counties, the following table presents the total amount budgeted towards operations and maintenance of public parks and green space. In both counties, the total amount to be spent on park O&M costs represented less than 0.5% of the total county operating budget.

Source: Erie and Niagara County CAFR 2005

For Erie and Niagara Counties, $5.92 and $3.55 were collected and spent for operations and maintenance of the parks in each respective county per person. With the addition of the Greenway funded projects in each county, the incremental increase per person for O&M costs related to these projects will be minimal. If residents are only required to pay $5.92 per person to currently run all the parks in Erie County, any addition resulting from the funded Greenway projects would be minimal. It should also be noted that this per capita spending is at the very low end of spending for O&M on parks when compared with other “benchmark” cities. See the table below for other cities and their spending on park related maintenance.

CHAPTER 4: ACTION PLAN

- Implementation Concept #2 - Assessing, Experiencing and Connecting to the River
The implementation of projects under this concept is expected to result in potentially substantial O&M costs to local, county and state agencies. The majority of the projects expected to be completed under this concept are related to providing and maintaining river access and recreational trail development. Given the large scale of the proposed trail system network with different options and alternatives, precise O&M estimates are not provided at this time. However, estimates developed by the American Trails Association show that annual operation and maintenance costs per mile for an urban trail system run between $2,500 and $10,000 per year (American Trails 2005). A variety of factors such as climate, facilities, and complexity of the system all impact the annual costs.

To further breakdown the expected O&M costs associated with trail management, the following table has been included. This table shows the total maintenance hours per mile of trail required to maintain the Schuylkill River Trail in Pennsylvania during 2000. The trail is a macadam trail that is 11.5 miles long with widths that range from 12 to 16 feet. As shown on the table trimming/pruning and safety/security were the two most labor intensive categories.

Source: American Trails 2006.
Note: Totals may not add due to rounding errors.

It should be noted that while the costs of trail maintenance identified above are significant, they do not all need to be borne solely by the host community. Many of the successful greenways and trails developed throughout the region have community groups that provide at least a portion of the required manpower to properly maintain their trails. Also these trails will have a region-wide impact on the economy and quality of life, therefore some of these costs could be borne by the community at large.

- Implementation Concept #3 – Protecting, Preserving, and Restoring Important Ecological Resources
The majority of the total costs associated with projects under this concept would tend to be the initial up-front capital and construction costs. However, some on-going monitoring and O&M costs may be required. For projects such as wetlands restoration, these on-going costs would include monitoring to ensure the effectiveness of the restoration and maintenance to remove any invasive species that may grow in the newly restored wetland. For projects that improve and create terrestrial or aquatic habitat areas, seasonal monitoring would be required to ensure that the
project is effective and to ensure that it is not damaged by storms or other causes (i.e. terrestrial areas or by driftwood and debris flowing down the river in the case of aquatic areas).

Acquisition of conservation easements and land banking projects would have virtually no direct long-term operation and maintenance costs associated with them. All maintenance costs occurring on these properties would remain the responsibility of the land owner or operator. Since it is not anticipated that large tracts of lands would be transferred to non-taxable entities, the local fiscal impacts of these projects would be at a minimum.

The O&M costs associated with various brownfield remediation programs and the restoration of former landfills could be significant. Routine on-going monitoring and ongoing sampling may be required to ensure that there is no migration of contamination from the proposed project areas. These monitoring costs, however, should not be additional costs, since contaminant monitoring should already be occurring apart from the greenway implications.

Finally, projects such as the correction of combined sewer overflows, repair of malfunctioning culverts to restore natural drainage and the removal of vacant commercial or industrial uses should have little or no long-term operation and maintenance costs assuming the initial work was designed and constructed effectively.

- **Implementation Concept #4 – Linking Special Places and Destinations – “Telling the Story”**

Similar to the Gateway Identification concept, many of the project costs related to this concept will be one-time in nature and involve initial design and construction. For example, landscape design, as well as the design of lighting fixtures, street furniture, and planting materials would all be upfront capital expenditures.

However, other aspects of projects that would fall under this concept would tend to be ongoing in nature. For example, implementation of outreach/education activities, such as websites, would involve ongoing costs associated with ensuring that the information on the site was still accurate and up-to-date. Advertisements, handouts, and bulletins would have to be paid for on a continuous basis. It should be noted that these costs are not typically considered maintenance costs, which are associated with built facilities or structures.

- **Implementation Concept #5 - Heritage Tourism and Economic Revitalization**

Projects such as the development of cultural and heritage centers and interpretive centers would all fall under this concept. Operation and maintenance costs associated with these facilities could be significant as driven by a project-specific basis. However, most of these proposed facilities would have to develop a separate revenue stream to cover the large O&M costs. Entrance fees and other sources would have to be identified during the planning and design stages. Given the large nature of these projects, any future government support would be analyzed before the funding was supplied so that local representatives could make an informed decision as to the overall fiscal impact of the projects.

- **Operations and Maintenance Recommendations**

Because Greenway funding is ear-marked for capital cost improvements, an implementation plan for the operations and maintenance (O&M) costs associated with each project must be established. For example, some projects will have associated user fees that will fund or offset the annual O&M costs associated with that particular project. These include such items as a
CHAPTER 4: ACTION PLAN

visitor’s center, nature/heritage centers, museums, youth camps, educational programs, commerce parks, aquariums, and marinas. Proposed projects such as these should be sustainable once the capital costs are spent for construction out of the Greenway funds. Projects that do not have user fees will be expected to meet the criteria set forth in the Greenway Plan and to be as sustainable as practical. For example, preference will be given to projects that have a local sponsor or partner such as a municipality, non-profit or volunteer group(s); that leverage/identify matching funds through local, state, federal and private funding sources; and that demonstrate economic viability, i.e., identify potential revenue streams or dedicated funding sources to cover costs.

In developing a framework for measuring and evaluating the potential, long-term O&M costs from the proposed projects, several limitations were encountered. These limitations primarily included the difficulty in applying typical ‘rules of thumb’ to the annual cost of these projects, because the specific details of the project, such as area of development, the combination of projects, overall size and construction costs, are unknown at this time.

To address this uncertainty, a conceptual framework of O&M costs are presented herein for evaluating typical projects proposed for the Greenway funding. These estimates are conceptual and project sponsors must develop their own estimates based on project specifics. Project applicants should prepare an O&M budget that considers the following costs:

- Maintenance: Routine and Remedial
- User Safety and Risk Management
- Programming and Events
- Resource Stewardship and Enhancement
- Marketing and Promotion
- Oversight and Coordination

Maintenace - For developed parkland, the sponsor or partnering organization should project an average of $3,000 per year for a maintenance budget per acre. If a park is 10 acres and is 60% developed, this assumes that 6 acres would require maintenance at a price of $18,000 annually. Utilizing the funding mechanisms described above, the sponsoring agency or partnering organization will administer the proper funds to maintain the long-term sustainability of the park.

Similarly, according to an article on the American Trails website *Trail Maintenance and Management*, an urban trail system can experience O&M costs of between $2,500 and $10,000 per mile, but can vary greatly due to conditions, climate and complexity (there are some quotes of only $300-500 per mile for more primitive trails). If a 20-mile trail system is established through the Greenway funds, this would result in an estimated $50,000 and $200,000 annually for O&M. This is an example where it would be prudent for municipalities and organizations to develop partnerships and cooperative public-private ventures that would ease the financial burden of funding these O&M costs. Since a 20-mile trail system would most likely cross multiple municipal borders, there should be a coordinated effort in maintaining the trail by local governments within all of the host municipalities.

Again, there are multiple local, state and federal funding agencies that would aid in covering O&M costs associated with these projects. The sustainability of any particular project will be dependent on no single municipality being burdened with excessive annual O&M costs.

http://www.littlerock.org/ParksRecreation/masterplanmap.aspx
CHAPTER 4: ACTION PLAN

**User Safety and Risk Management** - For projects requiring safety precautions and basic patrolling and risk management, the sponsoring agency (in most cases the municipality) should consider adopting and outlining a safety program to this new feature of their community. This could include patrolling a new stretch of a bike trail or a park, or the enforcement of fishing regulations in certain areas along the Niagara River corridor. Some agreement should be in place to ensure that public safety services will be provided, by whom and how these costs will be covered.

**Programming and Events** - Projects that involve ongoing programming and multiple events are in most cases those that would charge a user or entry fee to experience the event. The cost of O&M related to programming and events should be absorbed by these associated fees and should not impact the local municipality. Examples of programming and events include special presentations at visitor or nature centers.

**Resource Stewardship and Enhancement** - Resource stewardship is the long-term care and oversight of the natural or ecological resource. This, along with enhancement of the resource, would be under the management of a local sponsor or partner. Ensuring the ongoing stewardship of a natural resource would become the responsibility of the applicant (or their designee) to monitor, to ensure the longevity of the resource, and to monitor the resource following the project construction. Additional O&M funding for these projects would be available through local, state, federal, and other grant programs.

**Marketing and Promotion** - Marketing and promotion are essential components of the success of a project and are a part of the O&M associated with a resource. Agencies such as local, county, or state Parks Departments, Convention and Visitors Bureaus, local Chamber of Commerce organizations, and economic development entities generally provide funding for the purpose of informing and attracting people to an area or project to experience the amenities an attraction(s) has to offer. Partnership or sponsorship programs with these types of organizations in applying for Greenway fund should be strongly encouraged.

**Oversight and Coordination** - Similar to maintenance and stewardship, oversight and coordination will be important to the effective ongoing management of Greenway-funded projects such as trails, parks, or other waterfront facility or attractions. Achieving long-term project-specific goals and partnerships with other organizations and agencies can provide the framework for the ongoing effectiveness of Greenway implementation that will be valued by the community.

**D. Key Partnerships/ Organizational Framework**

The Niagara River Greenway Commission has a leadership role in Greenway planning. It is the visible manifestation of the Niagara River Greenway, and serves as the primary advocate for the Greenway.

Research on Greenways has underscored the importance of partnerships in building a successful Greenway. Because they inherently cross jurisdictional lines, building partnerships and cooperative relationships is an important element of the planning process. As noted in the introduction, the process of developing the plan itself, through meetings, discussions, debates and consensus building, has been extremely useful. This process sparked discussion, brought out inconsistencies and highlighted areas of broad consensus. More importantly, the process has helped build
partnerships and has developed a greater capacity to move the program forward.

Niagara River Greenway Citizens Advisory Committee (CAC) Meeting

Much of the institutional positioning that has occurred throughout the Greenway planning process has been partly due to the NYPA Greenway funds. Having a dedicated funding source gives the plan an immediate relevancy, since NYPA Greenway funds must be spent in a manner that is consistent with this plan.

Figure 9 illustrates the interrelationships among the many participants that fall under the Niagara River Greenway umbrella. The shaded area on the left side of Figure 9 represents the umbrella of the Niagara River Greenway Commission and the Niagara River Greenway Plan. Participants include local governments; federal and state agencies; stakeholders, non-governmental interest groups, such as non-profits and volunteer organizations, private enterprise and the general public at large. All of these stakeholders are important contributors to the Greenway. The policies and priorities established by the Commission will help define the course for all of these entities so that their combined efforts will make this a world class Greenway.

Outside the umbrella of the Greenway, Figure 9 illustrates funding sources, both from the NYPA Greenway funds and other competitive funding sources. Currently, the NYPA Greenway funds represent the only dedicated funding available for Greenway projects. However, it is possible that additional dedicated funding could emerge. The source of these funds could be the State of New York, as it is for the Hudson River Valley Greenway, or the funds may be contributed by a private foundation or conservancy organization. One of the goals of the Niagara River Greenway Commission will be to move forward with an effort to obtain or assist others in obtaining additional funds for Greenway projects. Funding could also be obtained through the competitive grants described in Appendix D.

The NYPA Greenway funds were created by contractual agreement as part of the federal relicensing process (see Appendix C: Summary of Niagara Power Project Relicensing Settlement Agreements). Some of the funds are compensations required as part of the federal relicensing process. Others are contributions offered by NYPA as compensations at the State or local level. Each fund was negotiated with the beneficiaries independently, and each is subject to the terms of the agreements signed with NYPA. These agreements establish a Standing Committee for each fund and specify what organizations sit on each committee. The Standing Committees are contractually responsible for selecting, administering and overseeing the projects financed by each Relicensing Settlement Fund.

Proposals for Greenway Funds may be forwarded by municipalities, stakeholders or private entities, either under the sponsorship of the Commission or independently. The Steering Committees have the sole responsibility for the allocation of the Relicensing Settlement Greenway Funds, provided that the proposed project is consistent with the Niagara River Greenway Plan. The Niagara River Greenway Commission does not have control over the allocation of Greenway funds or the decisions of the Standing Committees, but
there is a clear requirement that projects help to achieve the goals of the Niagara River Greenway. Project sponsors are obligated to consult with the Niagara River Greenway Commission, and the Standing Committees must evaluate the consistency of each request with the Niagara River Greenway Plan. It is expected that this process will be interactive, as indicated by the two-way arrow between the Commission and the Standing Committees in Figure 9.

The Niagara River Greenway Commission can also be an important partner for project sponsors who are applying for other sources of funding. The Commission anticipates establishing a process for consultation and support of competitive grant funding. The Niagara Greenway Commission will also establish a more informal process of voluntary review, to enable project sponsors to obtain feedback on the types of revisions that would improve their concepts.

The Niagara River Greenway Plan is a policy document which contains considerable flexibility in its application. It is advisory in nature, and does not mandate specific projects or regulations governing the actions of local governments. The role of the Plan and the Commission is to set general guidelines; it is up to the individual municipalities and other stakeholders to present projects and actions that will help further the vision and goals set forth in this document.

While gathering information on which to base the draft plan, the Commission heard repeatedly of resident concerns in relation to the use of eminent domain. While the Niagara River Greenway Commission has no power of eminent domain, nor may it hold real property, residents are fearful that a municipality, a state agency or other public authority would use eminent domain to achieve the purposes of the Greenway.

The Commission has no ability to limit the powers of local government, state agencies or public authorities. The State Land Acquisition Policy which guides the acquisition programs of the State Office of Parks, Recreation and Historic Preservation and the Department of Environmental Conservation frowns upon the use of eminent domain and requires such agencies to demonstrate the absolute need to acquire through such an adversarial process. In fact, since the enactment of this provision, neither DEC or Parks have used an adversarial eminent domain procedure to acquire lands for open space or recreation.

The Niagara River Greenway plan is a cooperative undertaking which among its purposes is intended to improve the quality of life for area residents. It would appear inconsistent with the plan for any level of government to use eminent domain against residential property to undertake a Greenway project without exploring and exhausting any and all alternatives to the taking of private property.

The Niagara River Greenway Commission will not seek the power of eminent domain, nor seek the use of it by its partners for implementation of the Niagara River Greenway Plan.

The plan is intended to remain relevant for years into the future. As such, it is important to assess the public’s perception of the plan; periodically revisit the document to assess whether the concepts included in the plan remain valid or whether a shift in emphasis is needed in order to remain consistent with the intent and substance of Article 39 and the plan. Changes in conditions or objectives, shifts in priorities and unforeseen changes in circumstances may create instances where changes to the Plan are appropriate. Therefore, the Niagara River Greenway Commission will establish
procedures for making amendments to the document.

The Local Government Advisory Committee (LGAC) and the Citizens' Advisory Committee (CAC) are two standing committees established under the enabling legislation for the Greenway Commission. These committees can be used to oversee the process of conducting periodic reviews of the Niagara River Greenway Plan to ensure that the plan remains a dynamic and useful document. The Commission also recognizes that there should be procedures established allowing citizens to raise potential issues, and a mechanism for soliciting public input on any proposed changes to the Plan. The CAC and LGAC will be used to facilitate that input. These committees will report to the Greenway Commission at least annually on the status of the plan and convey information and comments received in relation to the need or lack thereof for amendments to the plan.

The Niagara River Greenway Commission will review the information and comments received from the CAC and LGAC and make a determination as to the need to proceed with a plan revision. Significant changes in policy or content will be submitted to those cities, towns and villages within the boundary for approval prior to their submission to the Commissioner of Parks, Recreation and Historic Preservation for approval.

E. Linkages

One of the mandates of the Niagara River Greenway legislation is to recommend how the Greenway can be linked to upland and interior communities in order to promote linkages to the River. There are a number of existing features and assets that intersect with the Niagara River Greenway system, serving as junction points for interconnections with upland and interior communities. These interconnection points include the following:

- Lake Erie and Lake Ontario shorelines
- Seaway Trail
- Gateways established by the Bridges at the International Border with Canada
- Niagara escarpment
- Niagara Wine Trail
- Cayuga Creek corridor
- Erie Canalway National Heritage Corridor / Western Erie Canal State Heritage Corridor (Tonawanda Creek)\(^2\)
- Ellicott Creek corridor
- Lower Reach of Scajaquada Creek
- Buffalo Olmsted Park System
- Buffalo River

These connecting features represent an opportunity for creating both physical and conceptual linkages between the Greenway and the rest of the Buffalo-Niagara region. They have the potential to draw both residents and visitors to the Niagara River corridor.

Beyond the specific physical linkages, the success of the Niagara River Greenway will depend on how well the various layers and elements are interwoven and integrated.

\(^2\) These are the same geographic feature, but separate organizational entities. The Erie Canal joins Tonawanda Creek and follows the same alignment as the Creek within the Niagara River Greenway.
Niagara River Greenway

Organizational Framework

Figure 9

20 March 2007
CHAPTER 4: ACTION PLAN

The development of different types of centers along the corridor provides places for interpretation and “telling the story,” or building an appreciation for the ecological resources and environmental setting of the Greenway. The wayfinding system needs to be integrated into the trail system, which will be enhanced by interpretation. The more the various elements of the Greenway can be linked and connected, the deeper and more satisfying the experience will be for the users of the Greenway.

F. Transportation Issues

The transportation facilities that provide access to the Niagara River Greenway are essential to its overall success. Roads can provide access but they can also serve as barriers to public access and enjoyment of the Niagara River. Achieving a balance between providing ease of access to the properties and uses along a transportation route and facilitating traffic movement through the region is difficult. People want to be able to get to their destinations easily and without delay. However, the focus within the Greenway is to create a climate in which people can comfortably navigate through the system and enjoy all of its assets, activities and attractions, not to promote the rapid movement of vehicles through the area.

A recurring issue in the development of this Plan has focused on the future of specific transportation facilities like the Robert Moses Parkway. Transportation projects are planned and evaluated under a very specific and fairly lengthy process that can take years to complete. This process incorporates requirements that provide for intermunicipal notification and cooperation.

The planning process that is being used to develop the Niagara River Greenway Plan cannot provide the level of analysis and detail that is not only necessary but legally required for specific transportation projects.

The Niagara River Greenway Plan is a long-term, policy document, and is ill suited for the review of site specific transportation projects, and the Niagara River Greenway Commission does not have the legal authority to dictate how governmental agencies undertake transportation projects.

Bicyclists along the River

There are a number of ongoing and proposed transportation projects that could have a significant impact on the physical environment of the Niagara River Greenway. Between the source of the Niagara River and its mouth at Lake Ontario the following projects are ongoing or under consideration:

- Reconstruction of the Skyway
- Erie Street realignment
- Peace Bridge Plaza Alternatives, Buffalo
- Ambassador Niagara Signature Bridge and plazas, Black Rock
- Realignment of I-190 between north Buffalo and Tonawanda
- Extension of the Metro Rail (light rail rapid transit line)
- Pedestrian Accommodations Grand Island Bridges
- Replacement of the Grand Island Bridges
- West River Parkway Alternatives, Grand Island
- LaSalle Expressway Alternatives
- Robert Moses Parkway Alternatives (South and North)

As noted previously, this Plan cannot replace the independent planning processes and engineering functions that are associated with major capitol investment transportation
CHAPTER 4: ACTION PLAN

projects, which must incorporate a range of factors. However, these projects should strive to be consistent with the goals and policies established in this Plan. The enabling legislation for the Greenway requires each State agency to review its actions within the Greenway, and assess the consistency of those actions with the approved Niagara River Greenway Plan. While local, county and federal agencies are not under this mandate, consistency with the Niagara River Greenway Plan should be encouraged in planning at all governmental levels. In communities with an approved LWRP, federal agencies are required to follow certain procedures for any activity they undertake, fund or approve. State agencies are required to follow certain procedures for funding actions and for any action, including permits, for which they are an involved or lead agency pursuant to the State Environmental Quality Review Act. State agency activities listed in an approved LWRP are also subject to consistency procedures. Additionally, state agencies are required to follow the federal consistency requirements if they require federal approval of their activity or if the activity involves federal funding. At the local government level, cities, towns, or villages with adopted LWRPs enact similar consistency provisions applicable to their decision-making. As such, all Niagara River Greenway communities are encouraged to prepare a LWRP, and existing LWRPs should be amended to incorporate the Niagara River Greenway. Proposed projects would need to demonstrate consistency with the LWRPs - and the (inclusive) Niagara River Greenway Plan.

Many elements of transportation infrastructure along the waterfront are obsolete— the products of earlier patterns of land use or assumptions about future transportation needs. In general, the Greenway should facilitate rethinking of the transportation needs along the river corridor, and encourage projects to fit future transportation infrastructure to new uses anticipated under the plan. The greenway should facilitate alternative transportation along the river corridor, while always respecting environmental sensitivities in areas like along the Niagara Gorge. These steps will improve access to the natural resources and other assets along the Greenway corridor.

Pedestrian Walkway on Rainbow Bridge

Incorporating greater balance and choice into the transportation network also increases access for youth and seniors who do not drive. The nature of these accommodations should extend beyond the basics. Pedestrian accommodations need to be user-friendly, safe, and inviting. For example, there are sidewalks on the Grand Island Bridges, but their design discourages usage. These sidewalks are narrow, intimidating and lack a sufficient buffer zone to separate vehicle traffic from pedestrians and bicyclists. Due to ongoing maintenance on these bridges, only one sidewalk on each bridge is available for public use and both have unsafe linkages to connecting trails. In contrast, the accommodations across the Rainbow Bridge are more inviting. As a general rule, excess pavement should be discouraged, and design should reflect a greater emphasis on pedestrians, bicyclists and other non-motorized traffic.

Transportation projects within the Greenway should avoid creation of barriers between the water’s edge and the neighborhoods surrounding it. Interstate 190 in the City of Buffalo cut off physical and visual access to the water’s edge. To the extent that future
CHAPTER 4: ACTION PLAN

Transportation planning and improvements can mitigate this damage, they should be encouraged. Removal of the I-190 and building an alternative (non-interstate) route away from the Niagara River is obviously a very ambitious, expensive and long-term project. However, if redesign or relocation is able to go forward, it would be an important enhancement to the Greenway.

Transportation projects should seek to maximize access to the resources along the River. The realignment of Erie Street as proposed by the City of Buffalo, will re-establish viewsheds from downtown Buffalo to the waterfront, recreating a stronger connection between the City and the waterfront that helped create it. The City of Niagara Falls has endorsed the downgrading of the Robert Moses Parkway to provide better connections between City neighborhoods and the River. For routes near the water, the focus should be on access by alternate transportation modes, including non-motorized traffic, rather than a singular focus on the efficient movement of traffic.

Transportation projects should seek to maximize access to the resources along the River. The realignment of Erie Street as proposed by the City of Buffalo, will re-establish viewsheds from downtown Buffalo to the waterfront, recreating a stronger connection between the City and the waterfront that helped create it. The City of Niagara Falls has endorsed the downgrading of the Robert Moses Parkway to provide better connections between City neighborhoods and the River. For routes near the water, the focus should be on access by alternate transportation modes, including non-motorized traffic, rather than a singular focus on the efficient movement of traffic.

Accommodations for pedestrians, bicyclists

Transportation projects should seek to minimize their intrusiveness. More than ten years of intensive planning for the Peace Bridge expansion project has been complicated and faced with many constraints. Selection of a preferred alternative must be made within the context of a comprehensive evaluation process. However, there should be a preference for an alternative that complements Front Park, that helps restore the connections between the City and the waterfront, and is true to Olmsted’s vision. Figure 10 illustrates these transportation issues.
G. Greenway Implementation Concepts

Greenway development is inherently a long-term enterprise. It is a process that requires time-consuming activities including building public support, forming partnerships, assembling land, design, engineering and construction. Typically, all of this occurs while making the most of limited resources. For this reason, conceptual greenway master plans must be considered living documents that allow flexibility for unanticipated changes and opportunities. This effort is broader than typical master plans, which makes specific proposals for property that is under ownership of a single entity. It is even broader than a municipal Comprehensive Plan that sets a vision for a single community, and makes recommendations regarding general land use and zoning. This Greenway Plan is a long-term conceptual plan that looks for opportunities across a wide spectrum of publicly and privately held land, across more than a dozen municipalities, and for a wide range of activities. Unpredictable changes in the regional economy, environment, political climate and lifestyle trends over the long-term require a flexible greenway plan and an equally flexible implementation strategy.

Beyond these constraints, the Niagara River Greenway Commission, a duly constituted body charged with the development of the Greenway Plan, has limited control over any of the activities or projects that will ultimately make up the Greenway. The Commission cannot control land use or zoning, it cannot own or hold property and it does not have direct control over the distribution of funds. The role of the Commission is to develop this Greenway Plan as a framework for realizing the greenway vision. The framework guides implementation by addressing individual goals, responding to unanticipated opportunities and fostering partnerships among private citizens, interest groups, government and the business community. In fact, the conceptual plan will, by necessity, evolve over time as the Niagara River Greenway takes shape and as the issues facing implementation change. Widespread support for the greenway vision is, therefore, needed to ensure that implementation has the public and private sector champions needed to maintain enthusiasm and momentum for decades to come.

Throughout the planning for this project, certain priority issues kept emerging. These priorities, which formed the basis for the Greenway Goals in Chapter 3, were derived from public participation, the enabling legislation and input from the Niagara River Greenway Commission. The following five Implementation Concepts were identified based on these priorities. The intent is that these concepts will help jumpstart near-term projects.

The Implementation concepts are centered on the following concepts:

- Gateway identification
- Accessing, experiencing, and connecting to the Niagara River
- Restoring, preserving, and enhancing unique and sensitive environmental resources
- Linking special places and destinations to “tell the story” of the Niagara River
- Heritage tourism and economic revitalization

These Implementation Concepts are conceptual in nature. They are intended to illustrate possibilities, and they do not preclude other concepts and solutions which could be proposed in the future. Specific sites and priorities will be determined by a variety of factors, including timing, funding, site control, activity level and partnerships. In all cases, implementation of individual
CHAPTER 4: ACTION PLAN

projects are expected be conducted in a spirit of making positive contributions to the overall Greenway vision.

1. Gateway Identification

Gateways are physical or spatial devices that celebrate a transition from one distinct place to another. In the landscape, gateways are meant to be experienced dynamically, by movement through space—from one side of a gateway to the other. Within the Niagara River Greenway, gateways will be developed as entrances into the Greenway and as transitions through the Greenway, from one side to the other. More specifically, the use of gateways can be targeted to communicate particular messages, themes or attributes of the Greenway. This can be accomplished through a variety of methods, such as distinctive graphics, landscapes, plantings, architectural treatment, signage, lighting, color schemes or other methods.

- Lake-to-Lake Gateways (See Figure 11)

The shorelines of Lake Erie and Lake Ontario are linear landscapes that transition into the upper and lower Niagara River. These transitions are landmark opportunities to anchor the ends of Niagara River Greenway, reinforcing its physical and symbolic definition as a lake-to-lake greenway. Not only do these gateways serve the linear movement along the shoreline of each lake into the Greenway, they also provide an opportunity for a water-based gateway, entering the Niagara River by boat from either Lake Erie or Lake Ontario. Conversely, moving from the upper or lower stretch of the river into either of the lakes is an equally significant transition.

- Destination Gateways (See Figure 12)

Every land-based point along the Niagara River corridor that provides access to the Greenway represents an opportunity for a destination gateway. These gateways ensure that visitors, by foot, bicycle or automobile, have the sense that they have arrived at a special place. These destination gateways serve to welcome visitors to the Niagara River Greenway. Furthermore, destination greenways could fulfill an orientation function, providing directions for river and lake access points. Their mere presence indicates proximity to water and underscores the relationship between the River and its upland areas.

Destination gateway devices could be designed to relate specifically to their context, but should incorporate a consistent palette of graphics, architecture or landscape to project a consistent visual message throughout the Greenway. A hierarchy of
destination gateways could be applied to the various access points along the corridor, based upon a site’s visibility, popularity, significance and character. For example, simple landscaping and signage may be suitable for the majority of the numerous and frequent gateways, while other areas may require a more distinctive treatment. Significant architectural features, trailheads and interpretive features could be combined to establish major gateways in particularly strategic locations.

It is important to note that since gateways will occur throughout the Niagara River Greenway corridor, they will inevitably be located within rural, suburban and urban contexts. The creative use of similar design elements will ensure consistency throughout the Greenway while responding appropriately to the corridor’s diverse landscape context. In a similar manner, these design elements should be sensitive with signage and symbols of other, intersecting systems, such as the Erie Canalway. The goal is to integrate the various systems, while respecting their unique characteristics.

Lewiston Landing

- **Transition Gateways** (See Figure 13)
  The purpose of destination gateways is signifying arrival. Transition gateways, on the other hand, highlight passage through the Niagara River Greenway, from one side of the Greenway to another. In this manner, a transition gateway conveys visitors through a cross section of the Greenway, delivering the experience of passing over a river or stream and through its associated riparian or even urban environment. Often transition gateways are associated with a bridge, either over the Niagara River or one of its tributaries. Bridges offer existing opportunities to celebrate the pinnacle of this experience at its center.

Bridges traversing the Niagara River at Grand Island are clear examples of this opportunity. As a communication tool, these bridges are the easiest way to introduce exceptionally large numbers of people to the beauty of the Niagara River Greenway, and emphasize the special nature of the Greenway as a location.

Grand Island Bridge
*Photo by Clayton Eley- Isledegrande.com*

Transition gateways can also perhaps pique the interest of some visitors to learn about, explore and appreciate other aspects of the Greenway. Bridges that cross tributaries of the Niagara River, such as Tonawanda Creek (Erie Canal) or the Buffalo River perform similar gateway functions. Gateways at the tributaries also present the opportunity to highlight the fact that the communities and natural environments along these water bodies are linked to the Niagara River and important elements of the Greenway.

Another transition gateway opportunity is unique to the Niagara River. As the boundary between the United States and Canada, it is one of the few examples in the
CHAPTER 4: ACTION PLAN

country where an international greenway is possible. There is already a successful tradition of open space planning and preservation on both sides of the river, and New York can easily look to Province of Ontario as a precedent for the types of activities that may be most appropriate for the Niagara River Greenway. Furthermore, the bridges between New York and Province of Ontario are very significant as international transition gateways. They offer the opportunity to celebrate each country’s relationship with the river, as well as to emphasize international cooperation and the mutual intent to protect the natural and cultural resources of this watercourse.

- **Aquatic Gateways** *(See Figure 14)*
  A number of users of the Niagara River Greenway will access it by boat. There may not be large numbers of water access points, but these aquatic gateways are quite symbolic and should be effective in encouraging new users. Unlike other types of land-based gateways, aquatic gateways are more likely to depend upon the landscape and water than signage and architecture to evoke the gateway senses of transition and arrival, although these gateways should be clearly identifiable. These gateways also offer the opportunity to create water-to-land access points: places where boaters can tie up and take advantage of landside opportunities.

- **Gateways Network** *(See Figure 15)*
  Taken as a whole, the collection of many types and hierarchies of gateways would be developed as a coordinated network. Ideally, this network of Gateways will enhance the user experience throughout Niagara River Greenway while reinforcing the importance of notable hubs of activity. The implementation of a full gateway network would be coordinated with other system-wide programs including signage and graphics, interpretation and the development of multi-modal access to the Greenway, including trails, bridges, bikeways and roads. The gateway system for the Niagara River Greenway must also be coordinated with systems in place or planned under other initiatives, such as the Erie Canalway and the downtown Niagara Falls wayfinding system.

In addition to water access points, other features such as confluences, islands and other river features could be conceived as aquatic gateways.

CHAPTER 4: ACTION PLAN

2. Accessing, Experiencing and Connecting to the River

There are many ways to access, experience and connect to the River. These include scenic overlooks, water access sites (boat launches, marinas), “blue line” or water-based trails, parks, and recreational trails.

Currently there are several gaps in the current trail system as identified on the multi-use trail map (Figure 16). As this map demonstrates, there is a need to further develop and take advantage of the many opportunities to access, experience and connect to the river, whether by multi-use trail, canoe and kayak or merely offering an opportunity to experience the countless viewsheds along the Niagara River corridor from Lake Erie to Lake Ontario.

Improved access can take many forms. For example, a Scajaquada Creek kayak and canoe launch would improve access to the Scajaquada Creek, the Black Rock Canal and the upper Niagara River. This access provides an opportunity to experience the juxtaposition of the naturalized setting of the creek within a very urban setting.

Access is also related to multi-use trails and improved facilities for non-motorized use. Numerous municipal and stakeholder recommendations make it clear that local residents place a high priority on the completion of a “lake to lake” trail system. As part of the Niagara River Greenway Plan Implementation Concepts, a trail gap analysis was performed on five existing gaps in the existing network of trails. These analyses demonstrate potential trail alignments to fill the gap, as well as potential opportunities and/or constraints relative to each trail gap alignment. They are conceptual, and other alignments or solutions would be consistent with the Plan. The main point is that development of these trails would improve access to waterfront resources, providing the users with an enhanced physical and visual experience while simultaneously achieving the objective of a “lake-to-lake” trail system.

- Area 1: Buffalo-Black Rock Channel Area

(see Figure 17)

The proposed route is along the west side of I-190, adjacent to the Black Rock Channel. The southern tie-in point would be the existing multi-use trail adjacent to the Interstate 190 Porter Avenue/Peace Bridge off-ramp where the trail crosses from the west side to the east side of the highway. The northern limit would cross the West Ferry Street Bridge and tie into the existing Riverwalk on the south side of Squaw Island. The following pictures illustrate conditions along the proposed trail segment:

Looking North at Peace Bridge

View of Area between I-190 SB and the Black Rock Channel
Looking North under the Peace Bridge
CHAPTER 4: ACTION PLAN

OPPORTUNITY:
To provide a multi-use trail along the Black Rock Channel to connect the two existing trails at the north (Scajaquada Creek) and south (existing Multi-use trail) tie-in points.

CHALLENGES:
1. Need to determine type of trail to be constructed, i.e. a cantilevered trail off a retaining wall, a paved trail supported by a retaining wall or a combination of the two.
2. Access for construction. Construction equipment would most likely have to work from the water in some locations.
3. Security under the Peace Bridge
4. Crossing over or under the W. Ferry Street Draw Bridge and the safety/security issues at this location. If the trail met W. Ferry Street at grade, this could be a good location for access since parking is available at Broderick Park. Individuals would have to cross the bridge to access the trail from the parking lot.
5. Trail alignment at the former I-190 SB Toll Plaza; i.e. cantilevered walkway or at-grade. This could be a good place to access the trail by SB traffic since there is an existing pull-off area.
CHAPTER 4: ACTION PLAN

OPTIONS:
1. From the Scajaquada Creek tie-in point southerly to the area near the former I-190 SB toll plaza: The trail could be constructed at grade but would require some sort of retaining wall on the Channel side to provide support for the trail and an anchor for fencing. Once it reaches the existing concrete retaining wall at the widening for the toll plaza, the trail could either rise to meet the existing grade and run along the wall. With the recent removal of the tolls, additional land has been made available for this purpose, and the trail could pass by on the west side. As an alternative, the trail could be cantilevered off the existing concrete wall, over the water.

2. From the area near the former I-190 SB Toll Plaza to the West Ferry Street Draw Bridge: It appears that the trail could be constructed at-grade with the support of a retaining wall, either away from the water or by replacing the stacked rock wall that currently exists at water’s edge. At West Ferry Street, the trail would either have to rise to meet the grade of the bridge deck if desired, or pass beneath the bridge deck. Another option that may be available is to cantilever the trail off the existing concrete retaining wall supporting I-190 SB. This would allow the trail to stay at an elevation that would allow it to be tied in at grade to the West Ferry Street Draw Bridge deck.

3. From the W. Ferry Street Draw Bridge to the Peace Bridge: The trail could be constructed at-grade with the replacement of the existing stacked stone retaining wall at the water’s edge. It could also be cantilevered off the I-190 SB concrete retaining wall while there is sufficient exposure. It appears the wall is eliminated somewhere near the Peace Bridge.

4. From the Peace Bridge to the existing multi-use trail: The trail could be constructed at-grade and then in a cut section to meet the elevation of the existing multi-use trail. Retaining walls would have to be constructed for support of the trail and the embankment back to I-190.

The following is an artistic rendering of a cantilevered walkway:
Area 2: Niagara River Parkway (West River Parkway)  
(See Figure 18)

The proposed route would be from Beaver Island State Park at the southern terminus to the Buckhorn Bikeway at the northern terminus along the West River Parkway. Right-of-way is not an issue since private property along the roadway is limited to the east side of West River Road. It should be noted that West River Road used to be the northbound lanes of a former, 4-lane parkway, but is now utilized as a service road for the residences along its length. The southbound lanes of the parkway have been converted to the two-way West River Parkway. Although the initial thought was to utilize the median area between the West River Parkway and West River Road for the alignment of the trail, it is suggested that the alignment be shifted to the west side of the West River Parkway, adjacent to the water. This alignment would allow access to the two existing pull-off areas, as well as scenic rest areas that could be provided adjacent to the Niagara River.
CHAPTER 4: ACTION PLAN

West River Parkway Looking South at Traffic Circle at Beaver Island State Park

West River Parkway Looking South from Southern Pull-off Area
CHAPTER 4: ACTION PLAN

West River Parkway Looking South from Staley Road

West River Parkway Looking North from Staley Road
The West River Parkway becomes East River Road at the I-190 overpass. A portion of the bridge deck would have to be utilized by the trail to connect to the Buckhorn Bike Path on the east side. The existing bridge has adequate shoulder width for bicyclist and pedestrian use.
CHAPTER 4: ACTION PLAN

OPPORTUNITIES:
1. Provide a connection between the existing multi-use trail at the South Grand Island Bridge and along the South Parkway to the existing Buckhorn Bike Path and the North Grand Island Bridge along the Niagara River, taking advantage of its natural beauty and scenic vistas.
2. Use existing pull-off areas along the west side of the West River Parkway to allow access to the trail.

CHALLENGES:
1. Crossing drainage ditches/structures where there is currently limited width between the existing West River Parkway and a drainage ditch (See picture above of the West River Parkway Looking South from Southern Pull-off Area)
2. Reconstructing the overpass over I-190 to provide sufficient width for the trail and two vehicular travel lanes.
Area 3: Grand Island Boulevard
(See Figure 19)

The proposed route would be along Grand Island Boulevard from the current terminus of the Buckhorn Bikeway north of Long Road south to the terminus of the trail from the South Grand Island Bridge north of Staley Road. It should be noted that, although there is no separate bike path or trail, there is a signed Bike Route along Grand Island Boulevard. Pavement markings for this signed Bike Route have not been installed.
CHAPTER 4: ACTION PLAN

Grand Island Blvd. Looking South from Terminus of Buckhorn Bike Path

Grand Island Blvd. at Industrial Drive Looking South (note Bike Route sign)
CHAPTER 4: ACTION PLAN

Terminus of Paved Bike Path at Grand Island Blvd. North of Staley Road Looking North (note Bike Route sign)

Bike Path along Grand Island Blvd. at Tim Horton’s Drive just North of Staley Road
CHAPTER 4: ACTION PLAN

Bike Path along Grand Island Blvd. Looking North approaching Staley Road

Bike Path under South Grand Island Bridge
Grand Island Boulevard has a 100-foot right-of-way for the majority of its length, providing what appears to be adequate width to provide a trail. However, there are safety concerns involved with providing a multi-use trail across the numerous commercial driveways and intersecting roadways. The current design for the Bike Route on the shoulders of the roadway is actually a safer design for the bicyclists. There are no sidewalks along Grand Island Boulevard, presumably due to the commercial nature of the roadway. Other challenges include the open drainage ditches and utility locations.

**OPPORTUNITIES:**
1. Provide a direct link between the Buckhorn Bike Path (and the North Grand Island Bridge) and the multi-use trail at the South Grand Island Bridge along Grand Island Blvd.

**CHALLENGES:**
1. Safety issues crossing the intersecting roadways and commercial driveways.
2. Existing open ditch drainage systems that would have to be traversed.
3. Existing utility locations.
CHAPTER 4: ACTION PLAN

Area 4: Devil’s Hole/Power Project Area
(See Figure 20)

New York State is currently initiating a scoping process for the Robert Moses Parkway in this location. The preferred bike lane route, under any scenario for the Robert Moses Parkway, would be to cross the Power Authority structure on the west side of the former southbound lanes of the parkway. The entire southbound lane is closed at this time for reconstruction work being done by the Power Authority. There appear to be no capacity issues with the current traffic pattern utilizing the former northbound lanes for two-way traffic. The design set forth under the Pilot Project by NYSDOT and NYS OPRHP provides for two northbound lanes and a single southbound lane separated from the trail by concrete barrier (see attached rendering from the Pilot Project Evaluation Report). If the traffic pattern remains as is under the current conditions, the entire width of the southbound lanes could be used for the trail and observation area. Security concerns at the Power Authority structure may be an issue.

The southern limit would be the current terminus of the trail at the Devil’s Hole observation area, as indicated in the following pictures:
CHAPTER 4: ACTION PLAN

Current Terminus at Devil’s Hole Looking NB

North View of Robert Moses Parkway SB Lanes
In the vicinity of Devil’s Hole
The northern limit of the trail segment would be a connection to Artpark and its trail system. Although there are existing trails along the gorge to the south of the Artpark facility, the condition and location of the trails would preclude connecting a multi-use trail to them. This trail would pass highly scenic areas.
CHAPTER 4: ACTION PLAN

View of Rock Outcropping of Escarpment along Gorge Trail

Southern Terminus of Gorge Trail
CHAPTER 4: ACTION PLAN

A trail at this location would create safety issues, as well as constructability questions with the difference in grade between the Robert Moses Parkway and the Gorge Trail.

A possible tie-in point would be at the north end of the access road from Portage Road in the vicinity of the Artpark maintenance building, as shown in the following pictures:

Access Road to Artpark from Portage Road looking at Robert Moses Parkway
CHAPTER 4: ACTION PLAN

Access Road to Artpark at Drive to Maintenance Building
In vicinity of Robert Moses Parkway

Access Road to Artpark
Looking north at Drive to Maintenance Building and Robert Moses Parkway
CHAPTER 4: ACTION PLAN

This approach would require extending the trail along the current Robert Moses Parkway right-of-way, either in or adjacent to the southbound lanes. While the future configuration of the parkway is currently under study, a trail could be accommodated under various proposed alternatives. The existing northbound lanes could be converted to two-way traffic with little difficulty in this area, if the southbound lanes were converted to a trail. Another option would be for a single southbound lane in this area, adjacent to the trail. Locating a trail at the grade of the Robert Moses Parkway is also conducive to tying the trail in to Artpark.

OPPORTUNITIES:
1. Provide connection in trail system to allow pedestrians/bicyclists to travel between Artpark in Lewiston and Devil’s Hole (and on to Niagara Falls) and to enjoy the natural beauty and scenic vistas within this section.
2. Provide a viewing opportunity of the gorge at the Power Authority structure for pedestrians and bicyclists.
3. Provide a pedestrian and bicycle friendly means of access between the upper and lower escarpment in Lewiston.
4. Provide a multi-use trail separate from the vehicular travelway.

CHALLENGES:
1. Accommodating trail system in existing right-of-way, and possible need to re-route traffic.
2. Security issues at Power Authority structure.
3. Impact on the existing Robert Moses Parkway/ I-190 Interchange.
4. Power Authority acceptance of project.
5. Access point to Niagara University.
CHAPTER 4: ACTION PLAN

- **Area 5: Lower River Rd. – Lewiston to Youngstown**  
  (See Figure 21)

The proposed route is, in general, along the Niagara River corridor from Lewiston to Youngstown along State Route 18F. The southern terminus would be Artpark in Lewiston and the northern terminus would be the entrance to Fort Niagara in Youngstown, with the option of continuing it northerly through the Fort to the Robert Moses Parkway.

It seems the most direct route from Artpark to Lower River Road within the Village of Lewiston would be to follow 4th Street from the entrance to Artpark, northerly, crossing Center Street where it would follow State Route 18F northerly to Oneida Street. From this point, the trail would turn west and finally north again on Lower River Road. The Village Streets have 99-foot rights-of-way with stone or concrete sidewalks on one or both sides, depending on the location. Village streets are lined with mature trees. There is sufficient shoulder width on 4th Street to allow on-street parking.
Within Village of Youngstown an Off Road Multi-Use Path would Not be Possible. Therefore a Combination of Designated Bike Lane and/or Shared Roadway would apply.

Path Crosses Back to East Side of Road

*NOTE: Path Generally Follows Alignment of Existing 4 foot Wide Path along Lower River Road.

Path Crosses From East Side of River Road to West Side

Niagara River Greenway

Implementation Concept

Lower River Area
CHAPTER 4: ACTION PLAN

Oneida Street Looking East from Lower River Road

Lower River Road Looking North from Oneida Street
Concrete sidewalk is located on the east side of Lower River Road along the section from Oneida Street to Dutton Drive. At Dutton Drive, a cross walk is provided on the south side of the intersection to connect the concrete sidewalk to the asphalt path on the west side of Lower River Road.
CHAPTER 4: ACTION PLAN

Limited right-of-way (66 feet), physical constraints caused by erosion of the embankment along the Niagara River, existing bridge structures, on-street parking, mature trees and Village business centers, as well as driveway and roadway crossings, all create design challenges for providing sufficient width for a multi-use trail in this section.

Lower River Road Looking North, north of Dutton Drive

Lower River Road Looking South at Stella Niagara
CHAPTER 4: ACTION PLAN

Lower River Road at Pletcher Road Looking North
(Trail crosses to east side of roadway on the north side of the intersection)

(existing path crosses to east side of Lower River Road on north side of this intersection)
CHAPTER 4: ACTION PLAN

Main Street, Youngstown Looking North at Jackson Street and Entrance to Fort Niagara

Entrance to Fort Niagara State Park Looking South
CHAPTER 4: ACTION PLAN

OPPORTUNITIES:
1. Provide a connection between the Villages of Lewiston and Youngstown with a multi-use trail along the Niagara River, taking advantage of the natural beauty and scenic vistas.
2. While the primary trail should run along River as proposed above, a potential additional route would be to continue the multi-use trail along the Robert Moses Parkway from its present terminus at Pletcher Road in Lewiston north to Fort Niagara in Youngstown. A connection from the Portage Road entrance to Artpark to the existing trail would have to be established either along Center Street and Academy Park from Portage Road to the Robert Moses Parkway or down 9th Street to Mohawk Street and the current southern terminus of the trail. The grade on 9th Street to the north of Center Street would seem to preclude this option.

CHALLENGES:
1. Finding sufficient right-of-way to provide a 10-foot wide trail separated from the roadway by a minimum of 5 feet. If 5 feet can not be provided, then some sort of positive barrier, such as a Jersey Barrier, should be constructed.
2. Location of the trail within the Villages of Lewiston and Youngstown where parking is allowed on the streets. The multi-use trail should not take the place of sidewalks.
3. Safety issues with residential and commercial driveways. It is actually safer for bicyclists to have designated bike lanes on the shoulders of the roadway in areas with significant numbers of driveways than to have the trail located away from the roadway. The bike lanes should be a minimum of 5 feet wide in each direction.
4. Physical constraints exist laterally to the roadway. These constraints include erosion from drainage ditches, guide rails, existing bridge structures, utility poles, mail boxes, signs and mature trees.
3. Protecting, Preserving and Restoring Important Ecological Resources

Implementation of restoration, protection and preservation projects involving sensitive ecological habitats and resources associated with the Niagara River ecosystem, including adjacent upland areas and tributaries, is of critical importance. One of the primary goals of the Greenway Plan is to provide a framework for evaluating, funding and implementing future projects that are intended to benefit or enhance the unique and special environmental and ecological resources within the Greenway.

The objective of this Plan is not to identify specific projects to be funded, but to provide the foundation and standard by which proposed projects will be considered and evaluated. The intent of this section of the Greenway Plan is to identify the types of ecological and habitat improvement projects that would be considered appropriate, effective and consistent with the Plan. The projects identified serve to illustrate the scope and magnitude of activities that are intended to complement Greenway Plan goals and objectives.

It is important to note that this is neither an endorsement of such projects nor is this list intended to be limiting in any way. The Niagara River Greenway Commission recognizes that there are many ways to devise appropriate ecological projects that benefit the Niagara River ecosystem.

The goal of the ecological and habitat improvement concept is to recognize elements of the Niagara River ecosystem that are in need of protection or preservation. These fragile areas are in need of enhancement, improvement or restoration due to the current impairment of their natural functions and values. The Greenway Plan will draw attention to the terrestrial and aquatic elements of the Niagara River ecosystem, recognizing the habitat and functional importance each element plays in the overall health and vitality of the ecosystem as well as the educational opportunities provided to increase public understanding of ecological issues.

Aerial view of Motor Island and Strawberry Island: both contain sensitive and important habitat for many species of fish and both resident and migratory birds.

Sustainability must be a critical element of all future ecological enhancement proposals as well as any other proposal that is put forth within the Niagara River Greenway. Funding of projects that are sustainable or lead to a more sustainable ecosystem will be strongly encouraged.

While the Greenway Commission cannot acquire or own property, local municipalities may use Greenway funds for land acquisition or for the purchase of...
conservation easements or development rights. While natural resources inventories and educational research projects are appropriate efforts for funding, all funded activities should be action-oriented and result in advancing physical improvements, operational practices, or land use controls aimed at ecological enhancements or the restoration of compromised or lost functions and values.

One priority is removal of invasive species and use or establishment of previously extirpated native flora; therefore, any ecological restoration project must make use of native species to the maximum extent practical. Proposals to propagate native species for use in restoration projects along the Niagara River and western New York could be eligible for funding in that they would foster sustainable ecological, economic, and educational benefits within the Niagara River Greenway.

Some projects will be focused on a particular sensitive habitat type such as wetlands, while others will involve overlapping habitats consisting of submerged aquatic beds, emergent wetlands, riparian woodlands and forested uplands. Other site-specific projects may also result in significant benefits to the overall ecosystem. Beneficial projects could be in diverse areas ranging from undeveloped natural areas to remediation and reuse of a brownfield site. Under each of the habitat types listed below, the Plan describes relevant issues and opportunities and the types of projects that would be considered appropriate and consistent with the Greenway Plan. A representative listing of potential sites and locations for each category are provided based on public and agency input received during public meetings and correspondence collected during the Niagara River Greenway planning process. This list is not intended to be complete nor is it intended as an endorsement of a specific project; rather, it identifies representative sites and locations to provide a better understanding of the types of projects that would be most beneficial to the Niagara River Greenway.

This ecological implementation concept recognizes the following habitat types as having critical importance to preserving, protecting and enhancing the ecological value of the entire Niagara River ecosystem:

**Upland Areas**

**Importance** - Upland areas adjacent to or in close proximity of the Niagara River provide important habitat that benefits the use, function and value to the Niagara River ecosystem by other wildlife. Upland habitats may provide nesting and shelter to birds and other wildlife that depend on the Niagara River and its tributaries for food or migratory pathways. Upland areas are often critical in controlling and assimilating non-point source discharges and stormwater runoff that enters the Niagara River, and thus are important in maintaining and improving water quality. Upland areas may contain threatened or endangered species or unique forested habitats that are not found elsewhere along the Niagara River or in the western New York region. In addition,
CHAPTER 4: ACTION PLAN

these upland areas are typically the first to be identified for development due to their location, water views, scenic value and the general lack of regulatory controls. Often, such land use changes result in the permanent loss of the habitat functions and values.

Types of Projects - Upland areas suitable for protection, preservation or enhancements include unique woodlands or old growth forested areas, upland areas in various states of succession, important bird nesting or feeding areas, unique wildlife habitats, grasslands, or islands that provide unique or critical habitat values.

Open Space or recreational areas that provide habitat or ecological value would also be considered, provided existing or planned uses do not compromise these values over the long and short term. In particular, upland areas that are important as buffer areas to other sensitive habitats but are threatened due to development pressure are also considered eligible for protection.

Upland areas should have some proximity or ecological connection to the Niagara River. At a minimum, protection or enhancement of upland areas should result in a tangible or measurable ecological benefit to the Niagara River ecosystem. Scenic value and public access are important to the community as a whole, but ecological restoration of the affected resource area should be given primary consideration under this concept.

Representative Project Listing – Representative projects that were identified during the public and agency involvement process included the DeVeaux Woods Old Growth Forest, Lewiston Plateau, Niagara Gorge, Niagara Escarpment, Nine Mile Island, Tifft Farm Nature Preserve, northern end of Squaw Island, “Old” White Oak forested areas on Grand Island, Cherry Farm area, Ferry Landing south of Grand Island Holiday Inn, and Times Beach on the Buffalo Harbor waterfront.

Riparian-Floodplain Areas
Importance - Riparian areas are those natural transitional ecosystems typically found along a stream, river or watercourse. Habitat values vary depending upon slope, saturation gradient, soil type, topographic relief, potential for recurrent flooding or inundation and the extent of human intrusion or disturbance. These areas are considered critical to the health and vitality of river systems in that they often provide food, shelter, and nesting habitat for a wide variety of species that depend on the Niagara River or its tributaries for completion of their lifecycles. A key feature of the riparian setting is the functional floodplain. This natural landscape feature stores and slowly releases flood waters, filters and assimilates pollutants in surface water runoff and protects adjacent uplands from the erosive forces of fast moving water. In addition to the ecosystem functional values, natural floodplains also serve to protect property and contribute substantially to the health, welfare and safety of the general public.

Types of Projects – Project areas are typically found along land/water interface associated with the Niagara River and its tributaries. Some areas may include both upland and wetland habitats, or may contain
undeveloped areas that have been surrounded by development. Potential projects may include correction of point and non-point source discharges, repair or restoration of manmade and natural barriers that protect riparian habitats from erosion, minimizing development that encroaches on floodplains through the establishment of easements or land acquisitions by responsible authorities or stewardship groups, tributary watershed studies and improvements to prioritize areas for protection or restoration, shoreline restoration projects, or restoration of natural hydraulic functions caused by improperly placed or sized culverts.

Outfall on the Niagara River

Representative Project Listing – Woods Creek, Gun Creek, Big Six Mile and Little Six Mile Creeks, Spicer Creek, Ellicott Creek, Cayuga Creek Flood Control Project, Hyde Park Shoreline Restoration Management, Scajaquada Creek Improvements, Erie Canal, and LTV Shoreline restoration.

Wetlands
Importance – Historically, wetlands were found along much of the course of the Niagara River. Settlement along the Niagara corridor and subsequent industrial and transportation development have resulted in the loss of considerable wetland acreage. These losses have made the remaining wetland resources even more critical to the function and value of the Niagara River ecosystem.

The body of research on wetland functions and values has documented their importance to both the natural and built environments. Wetlands play a vital and well documented role in the function and health of the Niagara River ecosystem. Both the Federal and State governments have recognized that wetlands perform functions that are important to the interests of the general public. These include wetlands that:

- Perform significant natural biological functions including food chain protection, general habitat and nesting, spawning, rearing and resting sites for aquatic and terrestrial species;
- Are valuable as sanctuaries or refuges or serve as demonstration sites for the study of the aquatic environment;
- Facilitate natural drainage functions, control sedimentation, promote water flushing and circulation and ameliorate the effects of water currents;
- Shield other areas such as riparian zones or uplands from wave action, erosion and storm damage;
- Serve as storage areas for storm and flood waters;
- Are essential for the recharge of groundwater resources or are necessary to establish and maintain the base flows that are essential for certain aquatic species;
- Serve to protect water quality by filtering and assimilating dissolved and suspended solids typically entrained in surface runoff;
- Contain unique assemblages of species of flora or fauna or represent characteristics that are representative of natural condition prior to anthropogenic modification or influence.
CHAPTER 4: ACTION PLAN

Types of Projects – Wetland enhancement projects, restoration of natural flows and drainage, removal of invasive species, creation of open water habitats, removal of previous fill material, stormwater runoff control improvements, erosion control projects, educational trails and the enhancement or restoration of fish and wildlife nesting and rearing sites.

Representative Project Listing – Spicer Creek Restoration and Enhancement, East River Marsh Restoration, Buckhorn Island and Beaver Island enhancements and restoration, Motor Island Restoration, Strawberry Island, Bird Island Wetland Restoration, Klydell Wetland, Mudd Creek Wetland Enhancements in Tonawanda, northern tip of Tonawanda Island, Joseph Davis State Park Wetland Connection project.

Aquatic Habitat Areas

Importance - The aquatic ecosystem of the Niagara River provides a wide range of critical features including food, shelter, migratory routes; and spawning habitats for various species, including rare, threatened and endangered aquatic species residing in the Niagara River. In addition, maintaining water quality, aquatic habitats, and viability of the food chain is critical. Internationally, the Niagara River is recognized as an Important Bird Area (IBA) of international significance for the large concentrations of gulls and fowl that stage in the area during migration and as a wintering site. The River is also valuable to other water-dependent avian species which utilize the river as a migration corridor; and as an overwintering area for fowl, particularly in the vicinity of Strawberry Island. Maintaining the health and vitality of the shallow water and adjacent deeper water habitats is critical to protecting species diversity; ensuring the continued value for hunting and recreational sport fishing; and ensuring the use and enjoyment of the natural river systems by members of the public. Maintaining high water quality is important not only for fish and wildlife, but also for humans as the River is a source of drinking water.

Types of Projects – Installation of fish habitat/attraction structures; submerged vegetation enhancements; shallow water habitat improvement projects; remediation of contaminated sediments; identification/protection of sturgeon spawning habitats; protection of fowl habitat; and public fishing access points.

Wooded Wetland Complex along Spicer Creek, Grand Island

Old Submerged wharf structures along the eastern shore of Grand Island at the mouth of Spicer Creek.
CHAPTER 4: ACTION PLAN

Representative Project Listing – Motor Island Habitat Improvement Project; Frog Island Restoration; Cayuga/Bergholtz Creek confluence enhancements; Mudd Creek spawning habitat protection; Ellicott Creek Enhancements; Bird Island Submerged vegetation protection; shallows between Strawberry and Motor Island; Bell Slip spawning habitat protection; enhancement of the shallow water habitat in the vicinity of the mouth of Spicer Creek.

Impaired Habitats
Importance - Sites and areas that have experienced impairment due to past human activities or neglect may provide an opportunity to restore ecological productivity to the Niagara River corridor. While these areas are not, in their current state, ecologically sensitive or unique, they may provide an opportunity to benefit the Niagara River ecosystem or a particular habitat component if returned to a more natural condition. Returning these sites to a more natural condition may not restore its original undisturbed ecological value, but may improve habitat value and environmental functions, provide educational opportunities or provide waterfront access.

Projects within developed areas should utilize best management practices to minimize potential impacts to the River.

Types of Projects – Brownfield redevelopment, remediation of contaminated sediments, invasive species removal or management projects, removal of vacant commercial or industrial buildings, restoration of former landfills, remediation or correction of combined sewer overflows.

Buffalo Outer Harbor

Representative Project Listing - 102nd Street Landfill grasslands restoration, Buffalo Outer Harbor, NYPA Ice Boom lands, Squaw Island landfill, Cherry Farm, repair of malfunctioning culverts to restore natural drainage, Zebra Mussel removal programs, control of invasive species at Buckhorn Marsh and Tifft Marsh, cultivation of native species for local introduction.
CHAPTER 4: ACTION PLAN

4. Linking Special Places and Destinations—“Telling the Story”

The diverse and unique aspects of the Niagara River Greenway suggest an effort to interpret and share this rich heritage with others. The many fascinating stories that emerged during the creation of the Niagara River Greenway Plan acknowledged the uniqueness of this area and underscored the necessity of celebrating that heritage. The formula for gateways and reaches, described in the next section, establishes a rationale for the evolution of the Greenway, and also articulates how “Telling the Story” will contribute to an unforgettable user experience.

For both wayfinding and tourism reasons, it is advantageous to distinguish the sites where stories can be told in a detailed interpretive sense from those attractions that provide entertainment and/or information. The former sites provide richer opportunities for creating connections between people and place, and place and history.

Distinguishing what constitutes a story from other attractions has been difficult in some cases. The rationale that was used generally follows the recommendations contained in “Revealing Niagara: A Citizen Vision for Heritage and Cultural Tourism in the Bi-National Niagara Region” developed in 2002 by the Urban Design Project at the State University of New York at Buffalo. This report recommended the division of interpretive venues into these five categories:

1. The Landscape
2. The Bounty of Nature
3. Stories of War, Peace and Freedom
4. The Wealth of a Region
5. Enterprise in the Arts

These category descriptors, themselves, are highly suggestive of the kinds of sites that can be selected for interpretive treatment. Yet, for the purpose of distinguishing “Stories to be Told” from other attractions in the Greenway, it became necessary to further define the criteria for inclusion as a story. For the purposes of this discussion, a “Story” is defined as an historical landmark, piece of art or architectural treasure or a point from which a geologic, ecological or significant man-made enterprise may be interpreted.

In many cases, the specific location of the interpretive venues may be arbitrary. For instance, the importance of the Michigan Street Corridor in the City of Buffalo to the Underground Railroad or the designation of the Niagara River by the Audubon Society as an Important Bird Area of International Significance defies the selection of a single point to represent the larger area each represents. The final selection points will inevitably become apparent as the interpretation of each site develops.

In many cases, the specific location of the interpretive venues may be arbitrary. For instance, the importance of the Michigan Street Corridor in the City of Buffalo to the Underground Railroad or the designation of the Niagara River by the Audubon Society as an Important Bird Area of International Significance defies the selection of a single point to represent the larger area each represents. The final selection points will inevitably become apparent as the interpretation of each site develops.

Most importantly, and from a heritage tourism perspective, the stories to be interpreted represent what is special about this area. The array of interpretive sites can capture the imagination of the out-of-town visitor and regional resident alike. By distinguishing the stories to be told, they can be highlighted in both promotional efforts and in the landscape with signage.

Customhouse in Niagara Falls- Heritage Site
CHAPTER 4: ACTION PLAN

General Recommendations

There are two fundamental aspects associated with this implementation concept. From a content standpoint, the best approach is to distinguish the interpretive sites where the “Stories” will be told from those attractions that are exclusively of an entertainment nature or have relatively little interpretive foundation. There are many destinations that are important to the character of the Greenway, but that do not fulfill an interpretive function. The sheer quantity of attractions and interpretive sites within the Greenway effectively mandates some manner of division. Consequently, the recommended approach has been the development of a dual indexing methodology that visually separates the depiction of interpretive site locations from other attractions.

The second aspect involves the development of a uniform map graphic and legend that conveys the location and names of the interpretive sites in a standardized format. Figure 22 illustrates such a map graphic. The graphic development of a map is a key consideration in its uniform application. It involves continuity of format, colors, typographics and graphic imagery. This continuity will enable the same graphic to be used on signage, web site and print applications. It also promotes a high level of image continuity in all communication modes in which it is used.

Another important aspect of the map and legend is the color-coding of the five fundamental story categories. This strategy can have several advantages. First, it facilitates the visitor’s search for the legend items on the location map. The color references can also help communicate the relative density of similar categories in a particular area of the map. Moreover, it can provide image and message continuity between the map graphics and signage the visitor will encounter en route to the sites.

Wayfinding Implications for “Telling the Story”

There are many signage and wayfinding implications for “Telling the Story”. Presumably, there will be at least one interpretive sign in the vicinity of each interpretive site. The design of these elements should include graphics, materials and construction detailing that is similar to other Greenway signage, so that a strong and consistent image is reinforced throughout the system. Figure 23 illustrates an interpretive sign that was prepared to help tell the story of the Underground Railroad.

Much of the message content and visual design created to present information on interpretive signage can be utilized in other forms of communication relating to or promoting the Greenway. For instance, the text, photographs and graphics that are presented on these elements can also be utilized in:

- General brochures for the Greenway
- Informational brochures specific to the point of interest
- Educational material
- Print and broadcast media used to promote the Greenway
- Web site

If consistency of this content can be identified as a criterion at the onset and formatting established for all known applications, two important benefits can be realized. First, there will be a high degree of visual identity born of the fact that there are compatible graphic standards for multiple modes of communication. Secondly, there will be significant cost savings as the formatting (as well as a good deal of content) will be generated at the onset.

Similarly, map graphics will likely be generated for use on Orientation Signs at key Greenway gateways, trail heads and interpretive sites. These graphics can be created in a layered format, such that certain
CHAPTER 4: ACTION PLAN

kinds and quantities of information may be presented for different purposes. For instance, the general orientation map used at trail heads and at key Greenway gateways may be adapted to convey more specific information about the interpretive sites and attractions for brochures or a web site.

Map Graphic on Orientation Sign, Genesee Riverway

Another consideration for “Telling the Story” is the identification of these interpretive sites within the Greenway. The keying device used on those maps and orientation signs that depict site locations can be reinforced on signage devices that are visible to passing vehicular traffic. These signs could reference the coloration used to distinguish the various categories on orientation signage in addition to the description of the interpretive site.

Wayfinding

Wayfinding refers to the experience of orientation, and how a person is able to negotiate through the natural and built environment. A number of architectural and/or design elements can be used to aid orientation, including signage, other graphic tools and the physical design of the landscape.

The Niagara River Greenway offers some unique challenges to the development of wayfinding. The signage used to identify its bounds and attractions needs to attempt to project a singular image in an environment where businesses, urban neighborhoods and municipalities are striving to distinguish themselves from one another. The streetscape environment, especially in more urban areas, is already inundated with a variety of business and facility identification, traffic control, regulatory, street identification and route marker signage. Moreover, the long and narrow configuration of the Greenway suggests a considerable number of identifiers along its length, both for the eastern, land-based boundary as well as for water-based gateways.

Use of Consistent Logo System

Buffalo Olmsted Parks System

Another area of potential conflict involves the communication of a consistent message. There is an overlap of regional, state, organizational and commercial wayfinding efforts within the Greenway that creates the potential for numerous and varied identifiers and routing approaches. This is already apparent among the various promotional devices used to describe points of interest in this region.

Multi-Discipline Efforts

Wayfinding systems that are implemented in large or complex environments, such as the Greenway, often involve multi-discipline
The upriver ports of Carthage and Kelsey’s Landing were stopping places for boats bound for Canada. Escaped slaves arrived in Rochester via the "Underground Railroad" and looked for a friendly captain to take them across the lake and deliver them to freedom.

Lake Ontario was the terminus for the railroad and the last leg of a long and dangerous journey. Harriet Tubman was a "conductor" and Frederick Douglass was a "station master." Both arranged safe passage routes through western New York to Rochester and north along the Genesee River.

Many sympathetic Northerners would help in this cause—men like Myron Holley at Carthage and a free black family that lived at Kelsey’s Landing. (A historic marker in Maplewood Park shows the location of Kelsey’s.) At the mouth of the river, there was ferry operator, Richard Murphy, and in Charlotte there was the ardent abolitionist, Benjamin Barney, who ran the meat market on River Street.

In 1892, a number of notable visitors came to the village of Charlotte for breakfast at the the Cottage Hotel. Among them was Honorable Frederick Douglass, President Benjamin Harrison, the mayor and the governor. Over 800 bicyclists accompanied the entourage from downtown Rochester to the lake. The dignitaries were on their way to dedicate the Soldiers’ and Sailors’ Monument in Washington Square Park in downtown Rochester.

The religious revivals of the 1830s solidified anti-slavery sentiment in the Rochester area. Strong abolitionist sentiments favored the runaway slaves, and Rochester’s marshals were uncooperative with the Fugitive Slave Act.

The journey to the boats would often end at Charlotte. A house on the east side of Lake Avenue (just south of Denise Road) is rumored to have been a "safe house." The riverfront at "Skunk Hollow" was far enough upriver from the river mouth to allow ships to be boarded unnoticed and in the darkness of night.

George Ruggles came to Charlotte from Orleans County. He was an inventor and ship captain who would eventually become President of the Village of Charlotte. His descendants believe he took "precious cargo" to Canada on the schooner H.M. Ballou.

According to New York’s 1860 gazetteer, the population of Charlotte was 400 people. Many of her native sons answered the call to join the Union Army. In the summer of 1862, soldiers were summoned to act as port sentries to prevent anyone eligible for military duty from leaving for Canada in order to evade the draft.

Since England was sympathetic to the Southern cause, it was feared that Charlotte’s proximity to British Canada might make it vulnerable to attack. A company from the 26th New York Cavalry arrived in Charlotte on the steamer Cataract. They remained for several weeks to guard the port and pitch their tents at the triangle of River Street and Lake Avenue.

It was also suggested that the lighthouse and pier beacons be extinguished as a precaution to hamper a night invasion from the lake.
reinforcement. The flow chart on Figure 24 illustrates the many levels and avenues for providing wayfinding information. This approach encompasses a multitude of communication media as well as the corroboration of identification and directional cues through various visual design disciplines. Although signage is historically the primary wayfinding tool, several other modes of communication and design elements can contribute to a large extent. These include:

- **Print Graphics:** This includes brochures, maps and other print media used to convey the location of the Greenway and its points of interest as well as detailed circulation information as to how to approach and move about within the Greenway.
- **Web Site:** This tool may also contain maps and other wayfinding information that may be downloaded and printed by a prospective visitor. Web sites can provide a great deal more information regarding points of interest than is usually practical in print graphics.
- **Verbal Communications:** Reinforcement in this realm typically involves a documented protocol for site approach and circulation that is distributed to key personnel who routinely interface with the visiting public either face-to-face or over the telephone.
- **Landscape Design:** When used to enhance identity, such elements as paving surfaces, lighting fixtures, street furniture and planting materials can effectively reinforce wayfinding objectives.

The goal of the Niagara River Greenway Wayfinding Program should be to consolidate the form and content used to convey information pertaining to the Greenway and its attractions. Although this effort may initially involve signage devices, the protocol for content should be extended to all means by which wayfinding information can be rendered.

**Signage Issues**

From an identity perspective, signage must be highly visible in order to identify the Greenway, distinguish its bounds and route visitors to its attractions. Functionality, it needs to convey information as accurately and succinctly as possible.

**The Consistency of Identity**

From an image perspective, there are several key elements that need to be integrated within signage design to promote a singular identity for the Niagara River Greenway. These are:

- **Consistent Logo Usage:** The Greenway logo or logotype should be used consistently on all signage devices. The scale of the image may be altered (larger for gateway and trailblazer signs, smaller for pedestrian directional and interpretive signs) but its positioning relative to other graphics should be consistent.
- **Forms and Colors:** Signage needs to promote a singular image but, at the same time, stand out in the streetscape. This is particularly important in an area the size of the Greenway. This can be achieved by capitalizing on a unique shape or form and color usage that is similarly applied to all categories of signage.
- **Posts, Supports and Mountings:** There should be a similar level of consistency in the detailing of posts, brackets and support devices. This consistency should involve the material and coloration used for these devices.
- **Format:** To further distinguish Greenway signage, consistency should be applied to type styles, graphic layouts, rules and other graphic devices used to organize or convey information.
CHAPTER 4: ACTION PLAN

The systems approach to signage design is illustrated in Figure 25. The signage system developed for the Greenway should convey a high degree of consistency. To ensure a common vocabulary, one of the products that will need to be created is a Wayfinding standards package or manual that details these image-related elements and articulates how they will be utilized for each kind of sign that comprises the system.

The Consistency of Content
There is no more important element in wayfinding than message consistency. The large-scale and complex nature of the Greenway suggests formality in establishing its wayfinding standards. An effective Wayfinding Program is predicated upon accuracy and consistency in three important areas:

- **Nomenclature Standards:** This includes the formal terminologies used to describe such elements as trail heads, points of interest, streets and byways of approach, parking facilities and services. These standards are usually formalized in a Standards Manual and shared with all personnel who are involved with communicating wayfinding information.

- **Circulation Strategies:** This includes the documentation of preferred circulation approaches and pathways. The articulation of the pathways utilizes the terminologies established in the Nomenclature Standards.

- **Communication Protocol:** This involves the process of conveying wayfinding information, and especially changes in wayfinding information, to those individuals in an organization that communicate directly or indirectly with the visiting public. This group may include information technology personnel, marketing and communication directors, receptionists, telephone greeters and information providers, security personnel, in-house signage fabricators as well as designers and other consultants that may be involved with the planning or production of wayfinding devices.

For consistency of content across the Niagara River Greenway, a Wayfinding Standards Manual should be developed that articulates these standards and protocols for entire Greenway. The process for integrating changes should also be carefully mapped out to guarantee that any changes in nomenclature or circulation strategies will be conveyed uniformly in all expressions of wayfinding.

**Signage Categories**
The application of identity and message consistency should be reflected in a hierarchy of signage categories that function interdependently to orient, direct, identify, and inform. There are several basic signage categories that will be useful within the Niagara River Greenway, including:

- **Greenway Trailblazer signs:** To alert visitors that they are approaching the Greenway.

- **Gateway and Boundary Identification:** To identify the bounds of the Greenway at the primary node areas. This treatment may be similar to the gateway kiosks that are currently in use on Third Street in Niagara Falls.

- **General Identification:** To identify interpretive sites and attractions in the Greenway

- **Trail head Identification signs:** To identify trail heads and parking areas.

- **Vehicular Directionals and Destination Trailblazers:** To fine-tune visitor circulation to specific interpretive sites, trail heads, attractions and parking areas.

- **Orientation signage:** To provide map graphics and a directory of interpretive sites and other points of interest.
Niagara River Greenway

Linking Special Places and Destinations
Systems Approach to Signage Design

Figure 25
20 March 2007
CHAPTER 4: ACTION PLAN

- **Pedestrian Directionals:** To fine-tune pedestrian circulation at interpretive sites and urban environments. Along trails, these signs can confirm distances to milestone destinations, attractions and upcoming trail junctions and spurs.

- **Hazard Warning:** Along trails, this category will alert users to such conditions as steep grades and blind curves.

- **Street Identification:** To identify streets and byways within the bounds of the Greenway. This treatment might simply include the addition of the Greenway logo to the street name in a fashion similar to that used in the Buffalo Niagara Medical corridor.

- **Interpretive signage:** At the interpretive sites, this category will enrich and enhance the visitor’s experience of the Greenway. They will “Tell the Story” through imagery and text.

The Melding of Identities in the Niagara River Greenway
There will be occasions where trail, municipal and regional identities will need to be represented on Greenway wayfinding devices. These include such entities as the Seaway Trail, Erie Canalway Trail, the Niagara Wine Trail, the Village of Lewiston, the City of Niagara Falls and the proposed Shoreline Trail, a multi-use trail proposed by the Greater Buffalo Niagara Regional Transportation Authority that will eventually extend along the waterfront from Old Fort Niagara at the mouth of the Niagara River to the Town of Brant in southern Erie County. Melding the various graphic identities may be somewhat challenging and will require a graphic hierarchy as part of the proposed Wayfinding Standards Manual for the Niagara River Greenway. This usually involves a formal methodology for the treatment of nomenclature and graphic symbols. The Genesee Riverway Trail in the City of Rochester is a precedent for this graphic hierarchy. Wayfinding devices for the Genesee Riverway include reference treatment to the Canalway Trail and Genesee Greenway Trail.

The Niagara River Greenway will overlap a significant segment of the proposed Shoreline Trail. The identity of the proposed Shoreline Trail is unique in terms of both scale and autonomy. The greater scope (in length) of the Shoreline Trail, as well as the need to distinguish it from the many spurs and other trail systems it intersects, requires a high degree of autonomy for its signage and overall identity. Proposed signage concepts have not yet been applied to the Shoreline Trail, and it is recommended that its identity be melded with that of the Greenway to some extent (i.e. colors, materials, sizing and detailing of certain categories). It may be possible to incorporate a reference to the Greenway on signs identifying Shoreline Trail segments that fall within the Greenway. This might also include implementation of the Greenway logo in a reduced version.

The Shoreline Trail is a similar system that is being developed separately from the Niagara River Greenway, although sections of the two systems overlap. As part of the recommendations for wayfinding that were
developed for the proposed Shoreline Trail, a concept for creating distinct zones evolved that aimed to divide the Shoreline Trail into five parts:
1. Gorge View (Lower Niagara River)
2. Riverview (Rainbow Bridge to Erie County Line)
3. Riverwalk (Erie County Line to Lackawanna Town Line)
4. Sunset View (Lackawanna south to Town of Evans Line) and
5. The Beaches (Evans to Erie County southern boundary).

This strategy was devised to reference these areas or zones as intermediate destinations on signage such that orientation and directional categories could be simplified. A similar system could be developed for the Niagara River Greenway. Directional elements will reference destinations within the zone and the location of other zones. When the trail user crosses into a neighboring zone, he or she will see the destinations specific to that zone.

Consistency of Identity across Zones

As an example from the Shoreline Trail, a directional sign in “The Beaches” zone can emphasize the destinations within this zone. It will not, however, call out the specific destinations in the Riverwalk and other zones to the north. By limiting signage references to local zone destinations and neighboring zone names, signage can remain as simple and user-friendly as possible.

Coordination with the Proposed Shoreline Trail

As the Greenway encompasses the three northern-most zones of the proposed Shoreline Trail zoning strategy, there may be advantages to extending zonal references to the Greenway itself. The rationale for zoning the Greenway is just as relevant, if not more so. As such, it may be beneficial to either utilize the zoning strategy that has been proposed for the Shoreline Trail or, at the least, determine new zonal references such that they may be the same for both entities.

From an interpretive perspective, the identification of “Telling the Story” sites in the Greenway is entirely compatible with the regional representation of points of interest that the Shoreline Trail has determined to address. Consequently, the Shoreline Trail map graphic and orientation devices could be very similar in nature, content, and to some extent, even design to that which the Greenway would also seek to implement. Moreover, there can be many cost-saving benefits in an effort that aims to coordinate the map and orientation graphics produced for the Shoreline Trail and Niagara River Greenway. For instance, one elevation of a Shoreline Trail orientation unit could address trail-related information while the opposite face could promote the Greenway with its own specific maps and descriptions of points of interest. These units were originally designed to have a panel face dedicated to the trail and one that addressed regional attractions. As long as the Greenway components were compatibly designed, it could simply be inserted within the Shoreline Trail units.
5. Heritage Tourism and Economic Revitalization

One of the most important outcomes of fulfilling the vision of a Niagara River Greenway is its potential to improve the quality of life for the region’s citizens. Revitalizing the region’s urban centers, celebrating the region’s rich cultural and industrial heritage and protecting the region’s natural resources are sound economic development issues that can directly improve the quality of life in both Erie and Niagara Counties. Environmental protection and redevelopment are not mutually exclusive endeavors, but work together to help promote economic activity. Collectively, these strategies lead to stronger neighborhoods, a healthier environment, a vibrant economy and increased tourism.

Urban Centers
(See Figure 26)

Historically, most of the urban and industrial expansion of the Erie-Niagara region was directly or indirectly tied to the region’s water resources, specifically the Great Lakes, Niagara River and the Erie Canal.

Enhancing the water and land assets along the Niagara River will facilitate the region’s ongoing economic transition, raising the value of urban waterfront property for residential, entertainment, recreational and water-dependent and water-enhanced uses. This strategy reinvests in the existing infrastructure, consistent with smart growth policies and a national trend toward revitalizing urban neighborhoods. Enhanced quality of life features create a climate that is attractive to new business, encourages private sector investment, and helps build a market for new commercial opportunities.

Heritage and Cultural Centers
(See Figure 27)

Reinvesting in the existing infrastructure also promotes urban areas as appropriate locations for higher intensity greenway-related land uses such as heritage and cultural centers. These facilities are intended to draw large numbers of visitors, including local residents and tourists. They can be developed in coordination with an overall interpretive strategy to tell the stories of history, culture and industry in the Niagara River Greenway, as is discussed in the previous Implementation Concept on “Telling the Story”.

Visitor Center, Niagara Falls

Historically, Lake Erie, Lake Ontario and the Niagara River were catalysts for industry and many industries developed along the water’s edge due to manufacturing and shipping needs. Other industries required the affordable and abundant electricity provided by hydroelectric operations at the Niagara Power Project and its predecessors. It is important to celebrate the advancements in industry made possible by these resources and acknowledge the significant role that industry played in developing the region.

The area’s rich industrial heritage is integral to the development of heritage tourism and industrial heritage initiatives will provide important tourism venues that will aid in the
CHAPTER 4: ACTION PLAN

development of the Niagara River Greenway.

Among the most successful and innovative new cultural centers are those that blur the line between education and entertainment by combining learning activities with interactive experiences, and appealing to a range of ages and demographic groups. The proposed Niagara Experience Center in the City of Niagara Falls is an example of this type of center. These types of facilities are most appropriately located in urban locations, because they have good access to transportation infrastructure, utilities, hotels and commercial districts. This will also help alleviate development pressure in more sensitive undeveloped Greenway areas.

Ecological Centers
(See Figure 28)
Active heritage and cultural centers that attract large numbers of visitors are more adequately located in urban areas. Ecological centers are more ideally suited to a more natural setting, such reclaimed land where they are in contact with the types of natural resources, plants and wildlife they are intended to focus on. Tifft Nature Preserve is an example of an ecological center. Although these facilities may be open to the public as interpretive centers, they would be much more passive in nature, emphasizing education, research and conservation.

The design of ecological centers should combine landscape with architecture by incorporating the Greenway’s natural features through minimal site impacts. Ultimately, the goal of these centers is to play a leading role in preserving, enhancing and restoring the natural environment of the Niagara River Greenway.
CHAPTER 4: ACTION PLAN

Riverfront Preservation and Restoration  
*(See Figure 30)*

The fundamental goal of riverfront preservation and restoration is to fulfill the vision of continuous lake-to-lake access along the Niagara River. Arguably, the most important principle that the region’s diverse government, private and business interests can agree upon is that public open space preservation is a powerful economic development tool. While much of the Niagara River shoreline is and will remain in private ownership, it is a priority to maintain public ownership, and increase public access where feasible, whether through trail access, conservation easements, or other means.

Riverfront Access, Squaw Island

There is no shortage of research that confirms the increased value created by the preservation of open space. From a house located along a golf course fairway to the skyscrapers that line Central Park, public open space creates value and provides opportunities for development. Indeed, a 2002 survey co-sponsored by the National Association of Home Builders and the National Association of Realtors cited trails as the second most important community amenity, second only to highway access, and sidewalks, parks and playgrounds ranked third.

Among the most valuable attributes of public open space, however, are size and quality. Quality of open space can be a relative value and varies according to the functions of the property. Similarly, size is a relative characteristic of a property, but its connectivity to other open space, particularly contiguous public land, is of major importance.

H. Capturing the Vision

*The Niagara River Greenway is a world-class corridor of places, parks, and landscapes that celebrates and interprets our unique natural, cultural, recreational, scenic and heritage resources and provides access to and connection between these important resources while giving rise to economic opportunities for the region.*

All of the concepts and recommendations within this Action Plan section of the report are designed to help capture this vision. However, the overall greenway vision is inherently somewhat abstract. The precise look and feel of Niagara River Greenway in 2057 is difficult to envision because there are many unknown and unpredictable variables. This is precisely why a plan with built-in flexibility and adaptability is necessary for success. The nature of this Plan is as a vision plan, to define the characteristics of the Niagara River Greenway and identify strategies that will transform the Greenway into its full potential as a world-class corridor.

The five implementation concepts described previously (gateway identification; accessing, experiencing, and connecting to the river; restoring, preserving, and enhancing unique and sensitive resources; linking special places and destinations to “tell the story” of the Niagara River; and heritage tourism and economic revitalization) illustrate programs and policies with system-wide implications. Implementing these concepts will help ensure fulfillment of the Niagara Greenway goals, while maintaining a standard of consistency and quality throughout the Greenway. *(See Figure 31)*

The implementation concepts help capture a consistent visual and thematic message throughout the Greenway. Equally important...
CHAPTER 4: ACTION PLAN

is building upon the distinctive qualities at specific locations. The cataracts at Niagara Falls are clearly the centerpiece and jewel of the Niagara River Greenway. However, the diversity of experiences contained within the Niagara River Greenway also enriches its character and its uniqueness. They are critical components that contribute to its world-class status. The richness of the natural and built environment along the Niagara River is, in large part, due to the corridor’s incredible variety of significant and unique spaces and experiences that occur in a surprisingly short linear distance (about 30 miles, from Lake Erie to Lake Ontario).

Capturing the vision for the Niagara River Greenway will simultaneously establish system-wide consistency and celebrate the unique qualities of each place along the length of the Niagara River Greenway corridor.

Figure 32 visually depicts the distinctive places that comprise the Niagara River Greenway. In keeping with the framework classifications introduced by the Implementation Concepts, these places are described as gateways and reaches.

Gateways. As described under the Gateway Identification Implementation Concept, gateways are transitions from one distinct place to another. In the context of the Niagara River Greenway Vision, gateways describe locations along the corridor that are both transitions between distinct river reaches as well as unique locations in and of themselves.

Reaches. Typically a river reach is defined as a segment of water that is visible between bends in the river. In the context of the Niagara River Greenway, a reach describes a distinctive segment of greenway that occurs between Gateways. These transitions, in turn, are prominent features in the landscape, nodes of activity or significant landscapes. The gateways and reaches combine to capture the vision of a contiguous series of special events and places highlighting the Niagara River Greenway’s “unique natural, cultural, recreational, scenic and heritage resources.” These include the following:

- Gateway: Four Mile Creek State Park
- Reach: Lake Ontario Waterfront
- Gateway: Fort Niagara / Mouth of lower Niagara River
- Reach: Youngstown-Lewiston
- Gateway: Niagara Escarpment
- Reach: The Gorge
- Gateway/Centerpiece: Niagara Falls
- Reach: West Grand Island
- Gateway: Buckhorn Island
- Reach: North Grand Island
- Gateway: The Tonawandas
- Reach: South Grand Island
- Gateway: Strawberry Island
- Reach: Squaw Island
- Gateway: Mouth of upper Niagara River
- Reach: Lake Erie Waterfront / Olmsted Park system
- Gateway: Tifft Nature Preserve / South Park

Many of these individual gateways and reaches already have distinct identities. Over time, as the vision for Niagara River Greenway is achieved through the myriad of projects and activities that are being and will be implemented along the corridor, the unique and distinct character of these locations will become even more apparent. A world-class user experience will emerge: an enchanting alternation of experiences between gateways and reaches that emphasize the variety of “special places, parks, and landscapes” from one end of the Greenway to the other.

Niagara Falls will always be considered the most significant and identifiable place within the Erie-Niagara Region. As the vision for the Niagara River Greenway is fulfilled, it will be understood as the highlight of Niagara River Greenway, but also as the transition between the upper and lower Niagara River—a remarkable piece of an extraordinary system.
Northern Gateway
- Less developed node featuring the bi-national history of the Greenway and Lake Ontario

Lower River
- Natural reach of the Greenway system extending from the Falls to Lake Ontario, featuring the Gorge, Escarpment and energy industrial heritage

The Falls
- Tourist and visitor focused activity center directly relating the Greenway’s greatest asset and biggest attraction

Upper River
- Diverse reach of the Greenway system featuring the undeveloped, natural and rural character of Grand Island in contrast with the industrial edges on the east bank

The Tonawandas
- Urban activity center focused on the historic working riverfront

Headwaters
- The industrial and urban headwaters of the Niagara River with strong historic and cultural associations with neighboring communities

Southern Gateway
- Urban activity center built upon the urban infrastructure of Buffalo and Lake Erie infrastructure

Niagara River Greenway Area

Implementing Concepts
March 20, 2007

Figure 31
5.0 MUNICIPAL, STAKEHOLDER AND INDIAN NATION INPUT

There have been dozens of projects forwarded by municipalities, Indian Nations and various stakeholder groups. Clearly, the Niagara River is an inspiration, and the communities have responded by forwarding a wide range of projects. The figures on the following pages document this input, and indicate the locations of these various projects. They show a natural concentration of activity near the river’s edge, although they are not limited in geographic scope. Lists summarizing the input received from municipalities and stakeholders are included in Appendix E.

The list represents a wide variety of project types, at various stages of conceptualization. It includes projects that have a great deal of groundwork completed and are in the process of being implemented. It also includes projects that are early concepts, which will require much more work and thought before they are ready to move forward. Some projects are attached to a specific site or location, while others are more general in nature. In the latter category, some recommended projects are system-wide in nature, or pertain to a number of sites. Others are conceptual to the point where no specific site has been identified for the recommended activity.

The presentation of these projects in this plan does not imply endorsement by the Niagara River Greenway Commission.

Each project must be evaluated individually and on its own particular merits in terms of compatibility and consistency with the Niagara River Greenway Plan. They are provided here as a record of the grass roots public involvement process that has been the cornerstone of the Niagara River Greenway planning effort. The projects listed here are not intended to be limiting in any way. In fact, it is anticipated there will be a myriad of heretofore unknown projects that will be brought forward in the years and decades ahead that will advance the vision and add value to the Niagara River Greenway.

The communities participating in this process are to be commended on the amount of work and effort that has gone into developing the dozens of projects represented here. With very few exceptions, these projects are valuable concepts that will contribute toward making the Greenway a “world-class corridor.”

A. Municipal Projects
The Niagara River Greenway Commission has received input from every municipality within the jurisdictional boundary. The Commission did not require lists of projects to be submitted, although such input was welcomed. The projects and concepts forwarded by the municipalities are depicted on Figures 33 through 42.

B. Stakeholder Projects
There are many non-for-profits, special interest organizations, neighborhood groups, volunteer groups, and other stakeholders who have forwarded specific projects for the Niagara River Greenway. In some cases, these projects are also endorsed by the relevant municipality, while others have not yet gone through that layer of review.

The projects forwarded by stakeholders represent a similar range of completeness as the official municipal projects. It is noted that the organizational capacity of these groups varies. Some have paid staff and are capable of sponsoring projects directly,
CHAPTER 5: MUNICIPAL, STAKEHOLDER AND INDIAN NATION INPUT

while others depend upon volunteers, and will likely depend upon partnering with a municipal or other sponsor to help bring their project to fruition. These lists of projects and concepts are representative and do not preclude additional ideas. Stakeholder input is depicted visually on Figures 44 through 51.

C. Indian Nation Projects
There are two Indian Nations located in or near the Greenway boundary. Projects submitted by these Nations depicted on Figure 52.
1. Closure & Abandonment of Young Street-Convert to Parkland
2. Repair Breakwall & Stabilize Shoreline
3. Convert Industrial Intake to Scenic Overlook
4. Redevelop Water and Sewer Plant Buildings
5. Relocate City Hall-Development or Parkland Opportunity
6. Remediation / Demolition of Spaulding Fibre Pump House
7. Construct Pavilion and Outdoor Ice Rink
8. Complete Sheet Pile Break Wall
9. Replace Culvert / Roadway Improvements
10. Develop Golf Course & Recreation Area at Wales Ave. Brownfield
11. Create Amphitheater Seating at Band Shell Location
1. Multi-Use Trail - North Side of Ferry from Parkway to East River Rd. & East Side of East River Rd. to Beaver Island Parkway
2. Fishing Station at Former Location of Wastewater Plant
3. Passive Trails, Footbridge, Spicer Creek Wood Wetlands, Bicentennial Park
5. Shoreline Trail-Buckhorn Island State Park Baseline Rd. to North Tip of Park
6. Land Acquisition-Big Six Creek and Little Six Creek Ecosystem Preservation
7. Multi-Use Trail Eagle Overlook to Beaver Island State Park
8. Develop Nature Center
1. Gratwick Park Improvements
2. Improve Marina and Adjacent Commercial Properties
3. Wastewater Plant-Enhance Waterfront, Control Odor, Sell or Consolidate With Other Communities
4. Fisherman’s Park Improvements
5. General Cleanup/Enhancement Along River Road and Shoreline
6. Construct New Multi-Use Trails From Gratwick Park South to Existing Erie Canal Bikeway
7. Oliver Street Corridor Enhancement/Cultural Heritage
8. General Cleanup and Improvements to Existing Marinas
9. Little River Area-Maintenance & Protection of Waterway
10. Tonawanda Island Improvements-Develop Vacant Land, Encourage Businesses to Clean Up & Landscape, Bridge Improvements, etc.
11. Gateway Point - Stabilize Sea Walls, Infrastructure Improvements, etc.
12. Gateway Harbor - Miscellaneous Proposed Improvements
13. Webster & Main Street Corridor Enhancements
15. Improve Boat Launch, Add Canoe & Kayak Launch, Extend Multi-Use Trail
16. Old Boys and Girls Club Camp - Clean Up and Sell to Developers, Public Fishing Dock
17. Mayor’s Park Improvements
18. Red Jacket Club (Youth Camp) Improvements

General Recommendations
- Improve Public Access
- Establish Water/Recreation Related Activities
- Restore clean water and healthy habitats
- Showcase Natural, Cultural and Industrial Heritage
- Remove Obsolete Infrastructure Impeding Greenway Development
- Provide Signage (Interpretive, Pedestrian Directional, Gateway)
- Ensure Environmental Sustainability
- Incorporate Alternative Energy Sources during Project Planning
- Facilitate Widespread Use of Public Transportation
- Allow Commercial Development Only if Appropriate Use of Waterfront
- Document and Preserve Significant Industrial, Commercial, and Social History
- Develop Services & Facilities for Wide Range of Recreational Activities
- Protect and Enhance Natural Environment at Water’s Edge
- Create Microparks: Interconnected Chain of 25-30 Microparks From Tiffit Farm to Niagara Falls
- Increase Municipal Coordination
- Preserve Open Space
- Connect to Inland Communities
- Identify Funding Sources for Open Space Purchases
- Create Mini-Interpretive Sites & Pull-Offs
- Create Vistas
- Encourage Cross Visitation w/ Canada
- Guide Development of Private Property Within Greenway: e.g. Adirondack Preserve
- Maintain a Natural Environment
- Encourage Ecotourism
- Provide Regular Maintenance & Public Safety
- Guided Tours
- Create Setback Easement Policy for non-Water Dependant uses along the entire Greenway
- Follow Olmsted’s Vision: Connect Communities with Landscaped Trails
- Include Entire Olmsted Park System in Greenway
- Development of Planned Multi-Use Trail at Niagara Wheatfield High School
- Create a Continuous North-South Trail Linking Lake to Lake
- Reduce amount of Impervious Surface within River Corridor
- Retain Public Land within Greenway
- Prioritize Ecological Restoration on State Parkland

Indian Nations Recommendations
- Cultural History-Haudenosaunee & Native American History
- Demonstrate Contemporary Use of River by Native Americans
- Create a Native Heritage Trail Along the River
- Enhance Signage of Culturally Significant Areas
- Restore Native American Programming to NYS Parks
- Protect & Preserve Burial Sites and Other Cultural Sites
- Repatriation of Human Remains and Customary Objects
- Sale of Authentic Crafts Along the River & Within Reservation Park
- Provide Access to Areas for Ceremonial Purposes
- Demonstrate Customary Uses of River by Haudenosaunee
- Re-Plant Indigenous Species
- Co-Management with Resource Agencies re: Environmental Protection and Restoration
- Balance Economic Revival with Environmental Needs
- Safe, Healthy and Edible Populations of Plants, Fish, Birds and Animals
- Increase Level of Native Oral Histories in Interpretive Programs
- Utilize Haudenosaunee Artistry in Exhibits & Programs
- Acknowledge Haudenosaunee Contributions to Region
CHAPTER 6: GEIS

6.0 GENERIC ENVIRONMENTAL IMPACT STATEMENT

A. Purpose and Need
In September 2004, Governor Pataki signed the legislation creating the Niagara River Greenway Commission. That legislation defines the Commission’s purpose as undertaking “all necessary actions to facilitate the creation of a Niagara River greenway.” As part of that legislation, the Commission was directed to develop a draft of the Niagara River Greenway Plan and Generic Environmental Impact Statement (GEIS) in order to “… implement or cause to be implemented a linear system of parks and conservation areas that will...redefine the Niagara riverfront by increasing landside access to the river; creating complimentary access to the Greenway from the river; augmenting economic revitalization efforts and celebrating the region’s industrial heritage” The legislation also set forth a list of 15 elements to be addressed in the Niagara River Greenway Plan. This plan and the corresponding Final GEIS have been prepared in response to the legislation, as well as the grassroots support for a unified vision and coherent plan for the future of this resource. The Plan is necessary to help guide the development of the Greenway, including defining what a greenway will be and establishing a vision that will enable the region to achieve a world-class Niagara River Greenway. The Plan provides criteria to be used to evaluate activities, projects and proposals being advanced within the Greenway, in order to assess the consistency of a specific project with the goals and purposes of the Greenway. It also establishes a framework of implementation concepts that develop system-wide strategies for integrating the many assets and resources of the Greenway.

The region comprised of the counties of Erie and Niagara contains a wealth of assets and resources that are both natural and man-made. The Greenway Plan will serve as the foundation for organizing, evaluating, capitalizing upon and promoting these resources.

B. Description of Proposed Action
As mentioned in the previous section, the legislation establishing the Niagara River Greenway was enacted in 2004 and includes a list of 15 elements that must be addressed in the Plan. These elements are described in Chapter 1 of the Niagara River Greenway Plan. The plan is intended to guide the planning efforts throughout the Greenway by establishing a set of evaluation criteria with which proposed projects must comply. The action for review in this FGEIS has been defined as the adoption and implementation of the Niagara River Greenway Plan.

The Niagara River Greenway Plan and Final Generic Environmental Impact Statement (FGEIS) are both contained within this document. The Niagara River Greenway Plan is described in detail in Chapter 4 of this Document, and is included into the FGEIS (Chapter 6) by reference. The reader is encouraged to refer to Chapter 4 and previous sections of the Plan for a more detailed description of the Greenway Plan and planning process.

Projects that are undertaken, approved or funded by a state agency is required to demonstrate compliance with the State Environmental Quality Review Act (SEQR). As such, this chapter of the Plan addresses the proposed action and its implementation on a generic level. While this GEIS is necessarily focused on the types of environmental impacts that can reasonably be foreseen in most situations, individual projects may warrant a more site-specific environmental review and are not evaluated in the GEIS. The process by which future projects will be reviewed is described...
CHAPTER 6: GEIS

in Section J of this GEIS, “Future Environmental Reviews.” The Draft GEIS and the Draft Plan were the subject of public hearings and the public review process under SEQR. Public hearings were held on December 12 in Niagara Falls and December 13, 2006 in Buffalo. Comments on the Draft Plan and DGEIS were accepted until January 17, 2007. Changes to the Draft Plan and “comments and responses” are address in Chapter 7.

C. Alternatives
The alternatives to the proposed Niagara River Greenway are to take no action or to adopt the current proposal.

- **No Action Alternative.** This plan and the corresponding GEIS have been prepared in response to the 2004 legislation which created the Niagara River Greenway Commission and directed the Commission to develop a draft of the Niagara River Greenway Plan. As described in Chapter 1 Section A of this document, the legislation set forth a list of 15 elements to be addressed in the Plan. The ‘no action alternative’, or non-preparation of the Plan, is not a viable alternative since the legislation requires preparation of a Plan. At the implementation level, non-preparation of a Plan would mean no Plan for integrating the assets and resources of the Greenway; no set definition of a Greenway or boundary; and no vision to achieve a world-class Greenway. Individual municipalities would continue to be responsible for providing or procuring funding for individual projects that were not evaluated under a set of cohesive criteria.

- **Adoption and Implementation of the Greenway Plan.** This alternative, which is evaluated throughout this EIS, is a direct response to the 2004 legislation. This legislation requires definition of a Greenway; development of system-wide strategies for integrating the assets and resources of the Greenway; and establishing a vision that will achieve a world-class Niagara River Greenway. This alternative also addresses 15 elements required of the legislation. These fifteen elements, and plan criteria, are described in Chapter 1 Section A of the Plan. Selection of this alternative will meet the requirements of the 2004 legislation.

D. Environmental Setting, Impacts and Mitigation Measures
As mentioned above, the following discussion of Environmental Setting, Impacts, and Mitigation Measures applies to the proposed action, which is adoption and implementation of the Niagara River Greenway Plan. Chapter 2 of the Greenway Plan includes an Inventory of Greenway Resources which is hereby incorporated into this FGEIS. County-level and regional figures were utilized due to the generic nature of the Environmental Impact Statement. The GEIS was designed to assess the impacts of adoption and implementation of the Plan itself, as a document, and not any future projects that may result. Future projects may be required to undergo their own environmental reviews, based on the specifics of the project.

In general, the Niagara River Greenway Plan, when implemented, will provide benefits on a regional basis. Improved environmental quality, improved tourism development, improved connections to the Niagara River, direct/indirect economic activity and improved quality of life will provide real and substantial beneficial impacts that extend beyond the Greenway boundaries.
1. Land Use Controls and Patterns

The Niagara River Greenway boundary includes thirteen local municipalities in Erie and Niagara counties. Development within these municipalities and along the Niagara River Greenway is guided and controlled by a number of plans, proposals, and ordinances, all of which are targeted toward preservation, protection and revitalization. Each municipality has either a comprehensive plan and/or a Local Waterfront Revitalization Program which guides local development and permitted land uses. The New York State Coastal Zone Management Program is discussed in greater detail in Section D.2. of this GEIS.

Regional Land Use - Land use patterns along the Niagara River Greenway are mixed and they transition from one land use to another based on past development activity. Table 1 summarizes land uses in municipalities within the Greenway boundary, by County. As shown in the Table, residential development and agricultural comprise the largest percentage of uses throughout the Greenway municipalities. As shown in Figure 53, uses along the river transition from industrial/commercial and dense residential in the south, to low-density residential, recreational, and agricultural in the north. A more detailed discussion of land uses along the River and its tributaries follows.

* primarily includes Niagara River

Along the southern portions of the river (e.g., City of Buffalo, Town of Tonawanda, etc), land use is primarily industrial and transportation oriented, with some areas of dense residential development and scattered parks/open space providing public waterfront access. Moving northward along the river, land use becomes more residential and recreational/open space, with intermittent industrial and commercial uses (e.g., Grand Island, Town of Wheatfield, etc). The Greenway becomes more urban and industrial in the Town of Niagara and the City of Niagara.
CHAPTER 6: GEIS

Falls, particularly the lands between the North Grand Island Bridge and the Niagara Falls State Park. Below the Falls toward Lake Ontario, the land use becomes less dense with considerable Open Space and recreational uses and scattered residential development. Land uses in the Villages of Lewiston and Youngstown are more densely developed residential and recreational/open spaces, with the commercial areas tending to be removed from the River frontage.

As indicated in Figure 53, the southern portion of the Greenway is characterized by heavy industrial, commercial, and higher density residential uses. Commercial uses are centered on major roadways in the Cities of Buffalo and Tonawanda, and the Town of Tonawanda. Industrial uses are concentrated in the southern portions of the City of Buffalo, particularly along the waterfront; along the Niagara River in the Town of Tonawanda, and in the northeastern portion of the City of Tonawanda. In the Town of Tonawanda, residential parcels and some recreational uses are concentrated east of Military Road. In the City of Tonawanda, commercial and recreational uses are located further inland. In the City of Buffalo, uses along the River are predominately industrial or commercial (19%); vacant (19%), a category which also includes vacant industrial parcels; and wild, forested, or conservation lands. Water-dependent recreational/entertainment uses such as marinas, boat launches or similar activities account for nearly 10% of uses along the River. In the Town and City of Tonawanda, industrial, commercial, or vacant uses comprise 30% of land uses along the River. An additional 27% of uses are wild, forested or conservation lands. Public services account for 11% of uses.

The central portion of the Greenway along the River traverses the Towns of Grand Island and Wheatfield, and the Cities of North Tonawanda and Niagara Falls. Overall, land use in the Towns consists of low to medium density single family residential units. In Grand Island, land uses along the riverfront consist of open space (44%) and residential areas (23%), with small intermittent areas of commercial use along the east side of the island. The industrial and commercial land use areas are located toward the center of the island clustered along Grand Island Boulevard and Alvin Road. Commercial and industrial uses account for 1% of uses along the Niagara River. Areas along the Niagara River in the City of North Tonawanda are residential (44%), industrial or commercial (16%), or vacant (16%). Recreation/open space accounts for 3% of uses. Land use in Wheatfield is predominately characterized by residential and agricultural uses (50%). Agricultural land use is generally concentrated in the northern part of the Town. Along the River, industrial/commercial and vacant areas account for with 3% and 18% of uses, respectively. Along the River in the City of Niagara Falls, land uses are characterized by a mix of open space (8%), recreation/entertainment (8%), heavy industrial land use, commercial, and vacant areas (29%), residential uses (31%), and community services (11%). Several state parks border the Niagara River in the vicinity of the Niagara Gorge and the upper Niagara River. These parks are described in Section D.6 of this GEIS.

The northern portion of the Greenway traverses the Towns of Lewiston and Porter. Land uses near the river are mainly recreational (5%) and lower density residential (18%), with intermittent industrial and commercial activity. The Towns of Lewiston and Porter are also characterized by agricultural uses (62%). The Tuscarora Indian Reservation is located solely within the Town of Lewiston and east of the Village of Lewiston. The reservation has a total land area of 9.3 square miles and land use is characterized by residential and recreational uses. The Village of Youngstown is located along the Niagara River in the Town of Porter and is characterized by residential (40%), recreational/open space (20%) and uses categorized as vacant.
CHAPTER 6: GEIS

Approximately 7.5% of parcels along the River and its associated tributaries, totaling nearly 45% of the land acreage, are publicly owned. Owners of these parcels include the various municipalities, the State of New York and the counties of Erie and Niagara.

1A. Impacts to Land Use - Impacts to land use will be generally positive across the entire Greenway. The guiding principles set forth in the Plan will have beneficial impacts upon existing land use by enhancing, maintaining and preserving areas of open space; developing areas for active recreational opportunities; and improving water access where such access is currently limited or obstructed. This could be accomplished on parcels that are currently publicly owned, or those that are transferred or acquired through Greenway funds. These beneficial impacts will also have the added indirect effect of increasing land and property values within the Greenway.

Project specific changes in land use may, however, result in some localized land use conflicts. For example, the extension of trails and public access across waterfront lands currently in active industrial use may result in conflicting usage. It is also possible that constructing and operating a new tourism destination may result in a commercial development with associated increase in noise/traffic in an adjacent residential neighborhood. These potentially adverse impacts are not expected to be significant given the geographic scope of the Greenway and can be mitigated. Potential land use impacts can be minimized or avoided by ensuring that development of projects within the Greenway are sited properly and are designed/operated consistent with existing land use plans, zoning ordinances, waterfront/coastal zone regulations, and other local laws.

1B. Mitigation Measures – Potential Land use impacts of proposed projects can be mitigated by ensuring adherence to and consistency with local land use/comprehensive plans, zoning ordinances, floodplain regulations, and other applicable ordinances and regulations. The local municipality would be responsible for approving individual projects that are subject to zoning, site plan review, or other local land use plans.

2. Coastal Zone Management and Consistency
The State Waterfront Revitalization of Coastal Areas and Inland Waterways Act includes provisions to assure consistency of state actions, and where appropriate, federal actions, with the policies of the coastal area and inland waterways, and with accepted waterfront revitalization programs of the area defined and addressed by such programs. At the local government level, municipalities with adopted Local Waterfront Revitalization Programs (LWRP) enact similar consistency provisions applicable to their decision-making. These requirements apply to municipal agency decision-making, such as decisions involving zoning changes, subdivisions, site plans, special use permits, municipal construction projects, and funding activities.

In New York State, coastal zone consistency review falls under the purview of the New York State Department of State, Division of Coastal Resources (NYS DOS). As the State’s Coastal Zone Management Program Manager, it is the responsibility of NYS DOS to review all projects with State and federal agency involvement for consistency with the State’s Coastal Management Plan. To receive NYS DOS concurrence with a consistency certification, a project must demonstrate consistency with all coastal policies, which include the following categories:

- development
- fish and wildlife
CHAPTER 6: GEIS

- flooding and erosion
- public access
- safeguards
- recreation
- historic and scenic resources
- agricultural lands
- wetlands
- energy and ice management, and
- air and water resources.

Project applicants are required to identify the relevant policies, assess potential impacts, and assess consistency of the project with each policy. The New York State Coastal Zone Management Program authorizes the State to encourage local governments to prepare an approved LWRP that incorporate the state’s policies. The LWRPs typically expand upon the state’s coastal policies by identifying issues of local importance or priority, and defining a local waterfront revitalization area to encompass locally significant coastal areas, features or habitats. Where a community has approved a LWRP, projects undertaken within the LWRP boundary must demonstrate consistency with each relevant policy identified in the LWRP.

Seven municipalities within the Greenway have approved LWRPs (see Table 2). The LWRP boundaries are shown on Figure 54. As mentioned above, those communities that are not listed require consistency with the State coastal policies.

Discrete areas which are considered to be most important for their habitat value are designated by the State as “significant coastal fish and wildlife habitats.” State Policy 7 applies in communities where one or more Significant Fish and Wildlife Habitats have been designated.

The Coastal Management Program also oversees Scenic Areas of Statewide Significance (SASS). SASS designation helps protect the most scenic coastal areas from potentially adverse federal or State actions by assuring that certain performance standards are met before the action is approved. The CMP consistency provision provides protection at three governmental levels: federal, State and local. To date, all listed communities are on the Hudson River, but Niagara River communities may also be eligible. State Policy 24 applies to those communities where all or a part of a scenic resource of statewide significance has been designated.
CHAPTER 6: GEIS

2A. Impacts to Coastal Zone Management – As described in Chapter 3 of the Plan, the principles for the Niagara River Greenway promote high-quality, ecologically sensitive and sustainable activities and development. Among these principles are accessibility, sustainability, ecological integrity, restoration. Initial goals of the Greenway include improved access, protection and restoration of environmental systems, and promotion of long-term sustainability. In general, these principles and goals generally are consistent with the goals and vision of New York State’s coastal policies and approved LWRPs, which include protection of water-dependent uses; protection and restoration of ecological resources, including significant fish and wildlife habitats, wetlands and rare ecological communities; improvement of public access to and use of public land and waters, among others.

The Plan was developed to be consistent with and advance applicable State coastal policies, and, as approved LWRPs reflect applicable State coastal policies, the Plan was developed to be consistent with and advance the policies and purposes of the approved LWRPs identified in Table 2 above. Implementation of individual projects may impact resources, habitats, and communities within the coastal zone. Each individual project will be required to demonstrate, and will receive an evaluation of its consistency with the state’s coastal policies or the approved LWRPs as applicable.

2B. Mitigation Measures - Any potential impacts with the Coastal Zone or potential inconsistencies with approved LWRPs or policies of the NYS Coastal Zone Management Program will be mitigated by requiring that future proposed projects demonstrate consistency with the goals and vision of approved LWRPs or the State Coastal Zone Management Program.

3. Socioeconomics

Demographics - As noted in the 2000 U.S. Census, Niagara and Erie counties have a combined approximate population of 1,117,000. Niagara County and Erie County have population densities of 420 and 910 people per square mile, respectively. Overall, the total population of the Buffalo-Niagara region and Erie and Niagara Counties has declined over the last ten years.

The two largest municipalities within the Greenway in Erie County are the City of Buffalo and the Town of Tonawanda. The largest municipality in Niagara County located within the Greenway is the City of Niagara Falls. The Niagara-Erie region has a median household income of $38,400 and a per capita income just over $20,000, with 12% of the population living below the poverty line. Demographics of the Greenway municipalities are shown in Table 3 below. The table includes data for the Tuscarora Reservation, a tribe of Iroquois, which is located in the town of Lewiston. As shown in the table, most of the municipalities have higher median household incomes than the Niagara-Erie Region. With exception of the City of Buffalo, Niagara Falls, the Tuscarora Reservation, the municipalities have lower poverty rates than the region as a whole.

</tbody>
</table>

Revenues and Expenditures - Municipalities within the Greenway have budgets ranging from $1.1 billion (City of Buffalo) to just over one million dollars for many of the smaller municipalities. As indicated in Table 4, in 2004, revenues are derived from state, federal and other governmental aid, real property and non-property taxes, and other revenue sources. The local tax base of each municipality is derived primarily from real property taxes. Other major contributors to the local tax base are sales taxes, licensing and fees, and intergovernmental transfers. A mix of heavy manufacturing, light industrial and storage/warehousing uses within the Greenway contributes to a stronger tax base in some communities within the Greenway. For example, uses in Tonawanda include Tonawanda Coke, Huntley Coal, General Motors, DuPont, Goodyear-Dunlop, FMC, and NOCO Energy.

A breakdown of each municipality’s expenditures is shown in Table 5. In 2004, the municipalities that spent the smallest percentage of total budget on cultural/recreational expenditures were the cities of Buffalo, Niagara Falls, and Tonawanda, and the Village of Kenmore (3.1% to 5.7% of total budget). The towns of Wheatfield, Tonawanda, and Lewiston, and the Village of
CHAPTER 6: GEIS

Youngstown, spent the highest percentages of total budget on this same expenditure (10.6% to 33.9% of total budget).

Employment and Income - Total employment and total personal income in the Buffalo-Niagara MSA have fluctuated over the past several years. While there has been overall growth in personal income, the number of jobs (total employment) essentially has remained constant (See Table 6). According to statistics on personal income by industry, most individuals derive their income from manufacturing, government jobs, health care and social assistance, professional services and retail trade. The number of full-time employees by industry parallels the personal income industries mentioned above. The top five industries by number of employees in the Buffalo-Niagara Falls, NY MSA area are government, manufacturing, health care and social services, retail trade, and accommodation and food services (Bureau of Economic Analysis 2006).

The region’s economy also benefits from a key location and large endowment of natural resource assets. In addition to the economic sectors mentioned above, the Niagara frontier/WNY regional economy is linked to the natural resources of the Niagara River, Niagara Falls, and the Great Lakes; proximity to Canada; historic forts and battle locations; world-renowned architecture; and agriculture (fruits, vegetables and wine).

Tourism is a significant economic factor along the Niagara River Greenway Corridor. Niagara Falls is one of the premier tourist attractions in the State of New York and was ranked as the 30th most popular destination for foreign tourists visiting the United States by the US Department of Commerce, Office of Travel and Tourism’s Annual Survey of International Air Travelers. As stated in Section 2.A of the Plan, there are approximately 8 million visitors to Niagara Falls State Park per year. The economic impact of tourism in the Buffalo-Niagara MSA, particularly in Niagara Falls, accounts for more than $2.82 billion in annual spending, and wages of $1.5 billion.

In a study commissioned by the USA Niagara Development Corporation, it was estimated that approximately 9.3 million person trips were made in 2003 to tourist attractions in Niagara Falls, NY. An additional 14.2 million person trips were made to Canadian attractions during the same time period. This influx of tourists injects a large amount of funds into the regional economy. In 2002, an average person visiting the Greater Niagara region spent approximately $83.50 per person per day. Assuming 9.3 million person trips per year this equates to an injection of almost $780 million a year into the city’s economy (Economics Research Associates 2004).

Source: Bureau of Economic Analysis 2006

In addition to the obvious economic benefits from Niagara Falls tourism, the local economy benefits from other tourism and recreational activities that are directly associated with the river, such as fishing, recreational boating, and wildlife viewing. Throughout the Greenway, commercial uses such as restaurants, marinas, boat sales/services, and active/passive recreational opportunities such as fishing and hunting contribute to local employment and to spending. For example, in 2001, there were a total of 108,264 fishing license sales in Erie and Niagara counties. This represented approximately 10.4% of the total fishing license sales for the entire state (while Erie and Niagara only represented about 6% of the total State population in 2000). For the same year, according to a report published by the U.S. Department of the Interior, among other agencies, it was estimated that the average angler in New York State spent about $685 per year. Combining these two figures, there was an estimated $74.2 million expending on activities related to fishing in Erie and Niagara counties during the 2001 season. In addition, in western New York, recreational boating account for $159.5 million in trip and non-trip related expenditures, boat purchases, as well as direct, indirect and induced economic impacts. While this figure accounts for boating activities on more bodies of water than just those related to the Niagara River, it does show the significance of these boating activities to the overall economy.

### 3A. Socioeconomic Impacts - Implementation of the Plan is expected to have significant positive economic impacts such as direct, indirect and induced economic impacts arising from:

- Enhanced recreational opportunities;
- Increased residential property values for parcels within the Greenway and river;
- Increased use of the River ecosystem for tourism and recreational boating;
- Increase in industrial heritage and cultural tourism opportunities;
- Increase in eco-tourism opportunities such as bird watching, kayaking, and diving;
- Increased opportunity to attract hunters and fishermen from outside western New York;
- Returning vacant or underused property and brownfields to productive use and possibly to the local tax rolls;
- Provision of construction and tourism-related jobs arising from development of individual projects; and
- Increased employment in certain commercial, retail, entertainment, food service, and hotel/motel sectors due to influx of visitors and tourists.

The Plan and associated projects are not anticipated to significantly impact area population growth and density, or overall median household income or poverty rates.

Implementation of projects and components of the Plan will entail one-time construction and implementation costs as well as annually recurring operational and maintenance (O&M) costs.
CHAPTER 6: GEIS

These costs cannot be accurately projected as they will vary depending upon the project and associated annual costs. It is anticipated that some projects will have associated user fees that will fund or offset the annual O&M costs associated with that particular project. These include such items as visitor’s centers, nature/heritage centers, museums, youth camps, educational programs, commerce parks, aquariums, and marinas, among others. Proposed projects such as these would ideally be self-sufficient once the capital costs are spent for construction out of the Greenway funds.

Projects that do not have user fees will be expected to prepare an O&M budget that considers the costs of maintenance, programming and events, resource stewardship and enhancement, marketing and promotion, and oversight and coordination. Preference will be given to projects that have a local sponsor or partner such as a municipality, non-profit or volunteer group(s); that leverage/identify matching funds through local, state, federal and private funding sources; and that demonstrate economic viability, i.e., identify potential revenue streams or dedicated funding sources to cover costs.

A more detailed Assessment of the economic and Operations & Maintenance costs is provided in Appendix E of this Plan.

3B. Mitigation Measures – Since the adoption and implementation of the Greenway Plan will not result in any adverse social or economic impacts, no mitigation measures are necessary.

4. Brownfields

New York State Law defines the term "brownfield" as "any real property, the redevelopment or reuse of which may be complicated by the presence or potential presence of hazardous waste, petroleum, pollutant, or contaminant." The US EPA more broadly describes brownfields as abandoned, idled, or under-used industrial and commercial facilities at which expansion or redevelopment is complicated by real or perceived environmental contamination.

The decline in industrial operations in the western New York region has yielded a large number of brownfields throughout the Greenway. The NYSDEC, NYSDOS, and EPA administer funding, technical assistance and pilot programs to facilitate reuse of underutilized sites and help promote the revitalization of communities where brownfield sites have hindered redevelopment. The EPA has awarded over $1,000,000 in grant funding to coordinate community education efforts, and conduct site assessments at various sites in Erie and Niagara Counties. According to the agency, there are approximately 200 petroleum-contaminated brownfields sites throughout Niagara County, with 17 sites (approximately 386 acres) in the City of Niagara Falls. The Brownfield Opportunity Areas (BOA) Program grant funding has provided over $2 million for municipalities and community based organizations to provide an in-depth and thorough description and analysis for properties in proposed BOAs, with an emphasis on the identification and reuse of strategic sites as catalysts for revitalization. The Department of State, Division of Coastal Resources administers the BOA Program that provides funding to non-profit community based organizations for pre-nomination, nomination and assessment of properties that could be suitable for remediation and redevelopment. Current projects include an award of $375,000 to the City of Niagara Falls for the Highland Community to conduct a nomination study for an approximate 560-acre area with 15 potential brownfield sites; an award of $85,900 to the City of Niagara Falls for a pre-nomination study for a 1,100-acre area characterized by 30 to 45
brownfield sites in the Buffalo Avenue corridor; and, several grants of over $700,000 for the City of Buffalo to prepare several BOA plans, including the southern portion of the city and Buffalo River corridor.

The NYSDEC provides various means of support to public and private entities to support the redevelopment of brownfields through a Brownfield Cleanup Program (former Voluntary Cleanup program); the Environmental Restoration Program (former Brownfields program); and the State Superfund Program. The goal of the Brownfield Cleanup Program is to enhance private-sector cleanups of brownfields. Tax credits are available to a taxpayer who remediates a site under the program. Through the Environmental Restoration Program, municipalities are reimbursed for the cost of investigation and remediation activities of municipal-owned properties. Once remediated, the property may be reused for commercial, industrial, residential or public use. The State Superfund program is a cleanup program for inactive hazardous waste disposal sites, and hazardous substance waste disposal sites.

In the municipalities within the Greenway, 115 former industrial or commercial sites (over 2,530 acres) are enrolled in NYSDEC’s brownfield programs (see Table 7). While many of these sites are located on parcels that are in active productive use, others are vacant. The sites within the Greenway boundary are shown on Figure 55.

Source: NYSDEC, 2006

The Greenway Plan Implementation Concepts identifies the Niagara Mohawk Cherry Farm Site (Tonawanda) as the type of project which would qualify for Greenway funds for remediation and restoration. The 53.5-acre former landfill site was remediated several years ago and includes an 18-acre wetland, 2,550 feet of shoreline, a restored section of the Erie Canal and a section of the Riverwalk linear park. Future uses are limited to passive recreational activities.

**4.4. Impacts to Brownfields** - Implementation of the Greenway Plan will likely have beneficial impacts to brownfields and contaminated sites. The development of individual projects could be used to leverage other sources of state and federal brownfield funding to redevelop underutilized sites along the Niagara River. Cleanup and subsequent development of brownfields within the Greenway can directly and indirectly encourage infill development, attract businesses to suitable sites, provide jobs and increase local property tax revenues.

The extent of positive impacts involving brownfield redevelopment realized within the Greenway will depend upon the future involvement of private sector parties who are willing to work with local agencies and make the investment to appropriately address the real or perceived contamination. The goals, objectives, guidance and funding provided by the Greenway Plan will
be an important economic development tool in brownfield redevelopment in portions of Erie and Niagara counties.

4B. Mitigation Measures – Potential impacts associated with future brownfield redevelopment will be generally positive. In order to minimize or avoid any potential adverse impacts to adjacent landowners and land uses, potential adverse impacts of future brownfield redevelopment projects will be mitigated by ensuring that any “brownfield redevelopment” project will be subject to the appropriate review.

5. Community Services

There are numerous community facilities throughout the Greenway, as depicted on Figures 56 and 57. These include government facilities, police and fire departments, cultural and recreation facilities, religious establishments, healthcare facilities and cemeteries. A variety of educational facilities and services are also present, including public, private and parochial schools, colleges and universities, libraries and other educational facilities. In the northern portion of the Greenway the community services are clustered closer to the riverfront, whereas they are numerous but more widely spread out in the south.

5A. Impacts to Community Service - Adoption and implementation of the Greenway Plan will not result in significant adverse impacts to community services.

5B. Mitigation Measures - Since the adoption and implementation of the Greenway Plan will not result in any adverse impacts to community services, no mitigation measures are necessary.

6. Cultural Resources

Parks and Public Lands - The Buffalo-Niagara region and Niagara River corridor includes numerous parkland resources (see Figure 2). The most prominent and highly visited park within the Niagara River corridor is Niagara Falls State Park, which encompasses the lands and waters surrounding the Falls. In addition, a chain of State Parks extends along the length of the River, both north and south to the Lake Ontario and Lake Erie shorelines. Figure 2 illustrates the location of parks and parklands throughout the region, and Table 8 identifies state, local and county parks and public lands within the Greenway boundary.

Figure 57
While most of the parks identified on Figure 2 were designed to serve the recreational needs of local residents, many are important resources along the Niagara River and attract visitors from the Western New York region and across the State. These parks include the Tifft Nature Preserve, the Small Boat Harbor, Erie Basin Marina, LaSalle Park, Squaw Island Park, Broderick Park, the Bird Island Pier, Tow Path Park and Riverside Park in the City of Buffalo; Isle View Park in the Town of Tonawanda; Niawanda Park in the City of Tonawanda; Gateway Harbor in the Cities of Tonawanda and North Tonawanda; Fisherman’s Park and Gratwick Park in the City of North Tonawanda; and Lewiston Landing in the Village of Lewiston.

The Frederick Law Olmsted parks in the City of Buffalo and the City of Niagara Falls are also a unique resource of this region. In Buffalo, Olmsted Park System includes Riverside Park, Delaware Park, Martin Luther King Jr. Park, Front Park, Cazenovia Park and South Park, as well as a number of connecting parkways and circles. In the City of Niagara Falls, Frederick Law Olmsted was instrumental in the preservation and restoration of the lands that now comprise Niagara Falls State Park, also known as the Niagara Reservation. The New York State Office of Parks, Recreation and Historic Preservation (OPRHP) manages the Olmsted landscapes in Niagara County, while the Buffalo Olmsted Parks Conservancy, a not-for-profit organization, is charged with the oversight of the Buffalo Olmsted Parks. Both groups have or are in the process of developing master plans to preserve these landscapes for their cultural and historic value, as well for their open spaces.

The region also has an extensive network of both land and water trails, which can be considered “linear parkland.” Figure 3 depicts the existing trail network through the waterfront region and connecting trail systems. Several new trail systems are in the planning and development stage, including a scenic trail between Lewiston and the City of Niagara Falls, trails in the Town of Tonawanda tying into the Riverwalk, and the Outer Harbor Trails in the City of Buffalo, which will provide waterfront access along previously inaccessible Niagara Frontier Transportation Authority (NFTA) lands. Numerous proposals for completing segments of trails throughout the region are also in the process of obtaining funding. In addition, the Greater Buffalo Niagara Regional Transportation Council (GBNRTC) is leading an effort to implement a “Shoreline Trail” system. The Shoreline Trail will run along the Lake Erie and Niagara River shorelines from the southern end of Erie County in Brant to the mouth of the Niagara River in Porter. Completion of the Niagara River section of the Shoreline Trail is also a priority for the Niagara River Greenway. More information about the existing trails, trail gaps and efforts to complete the network is included as an Implementation Concepts in section 5 of the Plan.

There are also a number of important waterfront access sites along the length of the River. Many of these sites are associated with public parkland. Figure 4 indicates the location of water access, including boat launches, marinas and official fishing access points. There are also many locations along the length of the River and its tributaries where there are informal fishing access spots and locations where paddle powered boats such as canoes and kayaks can be launched.

Heritage Sites - A number of properties in the region are listed on the National Register of Historic Places, which is the nation’s official list of significant buildings, sites, properties, archeological and cultural resources. Properties on the National Register have been evaluated according to set criteria and are officially designated by the National Park Service as worthy of preservation due to their architectural, cultural and/or historic significance. Many of these
CHAPTER 6: GEIS

historic sites are located along the Niagara River. Of these, over a dozen sites in the region are also designated as a National Historic Landmark or National Historic Site, which are the highest designation of historic and/or architectural significance. All but one of these dozen sites is located within the boundary of the Greenway. There are also a number of historic districts, areas where there is such a concentration of historic or architecturally significant structures that the entire neighborhood is designated as historic. In addition, many historic and culturally significant sites and buildings across the region are eligible for listing in the National Register of Historic Places, but have not been officially designated. Figure 7 depicts historic districts, sites that listed or eligible for listing and significant sites that have been identified in local planning documents but that are not officially on the National Register.

6A. Impacts to Cultural Resources - Adoption and implementation of the Greenway Plan will result in significant positive impacts to existing parks and recreational facilities throughout the Corridor. The Plan lays the foundation for the protection, enhancement, preservation, and improvement of parks and associated recreational lands/facilities. The Plan will allow parks to be improved and/or expanded to provide more public waterfront access and improve the quality of services and amenities currently provided at these parks. In addition to state/locally owned parks, other recreational facilities that may benefit from the Plan include bikeways, trails, scenic overlooks, historic/heritage sites, public fishing access points, recreational boating launching facilities, marinas, and disabled access programs.

6B. Mitigation Measures - All properties containing historic and/or cultural resources are subject to the protection provided by the State Historic Preservation Act of 1980. This law requires that all state agencies consider historic resources during project planning. Adoption and implementation of the Greenway Plan will not have adverse impacts on cultural resources, therefore, no mitigation measures are required. Potential adverse impacts to cultural resources resulting from specific projects will be mitigated by consultations with the NYS State Historic Preservation Office (SHPO). As appropriate, the SHPO will determine the appropriate level of site investigation, inventory, documentation, evaluation and mitigation to ensure mitigation of potential adverse impacts to cultural, archaeological, historic and/or heritage resources.

7. Access and Circulation

The Greenway is serviced by a variety of roadways ranging from major limited-access arterials to small minor collector and connector streets. Although the major roadways, including Interstate Routes 90, 190 and 290, provide an efficient means of moving motor vehicles into and out of the region, they are not safe alternatives for use by pedestrians or those utilizing non-motorized means of transport. Many of the major thoroughfares are complemented by multi-use trails and in some cases designated bike lanes (see Figure 3), but even so there are still gaps in this trailway system.

Shoreline and waterside access is also available along the Niagara River shoreline, including marinas, street ends, parks and boat launches (Figure 4). There are many locations that provide access for shoreline fishing and public viewing.

7A. Impacts to Access and Circulation - Implementation of the Plan, particularly through improved connectivity and enhancement of trails, water, and gorge access will result in significant beneficial impacts to users of the Greenway. More effective and consistent signage
CHAPTER 6: GEIS

and wayfinding tools also will be a beneficial impact resulting from the Plan. Not only will vehicular and pedestrian access be improved and made safer in general, handicapped access opportunities will also be strongly encouraged.

Impacts associated with increased traffic volumes and impaired traffic circulation by future Greenway projects will be addressed on a project-specific basis. Since a primary tenet of the Plan is to encourage pedestrian and bike path access to the Niagara River and points within the Greenway, a significant increase in vehicular traffic will be discouraged. However, it is likely that as development projects become realized and tourism/public use of the Greenway expands, that some increase in traffic and need for parking near destinations or key linkages will result on a localized, site-specific basis (e.g. vehicular access to and parking for an Underground Railroad Museum or at the connection with the Erie Canal Heritage Corridor). It is expected that this increase will not be significant within the Greenway, and can be mitigated through effective project siting and design. Potential increases in traffic volumes, circulation, and parking demand will be a criteria considered in funding and undertaking future projects. While increases in traffic and parking are not the desired outcome of the plan, this would be an indicator that the Plan is being effective at promoting and realizing public use/access/enjoyment of the Niagara River and that direct/indirect economic benefits are also being realized within the Greenway.

7B. Mitigation Measures – Potential impacts to traffic and pedestrian flow and circulation will be mitigated on a project-specific basis based on consultation and input from involved agencies such as NYSDOT, State Parks, County Department of Public Works officials, public safety officials, and local municipalities. The Greenway Commission will consider impacts to flow and circulation in their evaluation of proposed projects, and may request input from appropriate traffic and transportation officials. Adherence to standard designs and specifications for roads, trails, pedestrian facilities, and parking lots will be required for all proposed projects.

8. Geology, Soils and Topography

Geology

Geologic Formations - The Niagara Greenway is located within a very large geologic region which extends from Lake Michigan to Georgian Bay. The areas south of Lewiston are comprised of Silurian and Devonian middle Paleozoic rock south of Lewiston, and areas north of Lewiston contain Ordovician upper Paleozoic rock. This rock formation, along with the functions of pressure, heat and erosion, has largely led to the creation of the Niagara Escarpment. Layers of hard rock were deposited on layers of soft rock and were not horizontally aligned. Over time, the softer layers have eroded, but are protected by the harder upper layer, which causes cliff erosion. The result of this erosion is the formation of escarpments and other natural cliffs including Niagara Falls.

Bedrock - The bedrock found throughout the area is stratified limestone, dolomite and shale of the Silurian and Devonian age. The hard nature of this material has contributed to the creation of the natural features in the area including the Niagara Gorge and Niagara Falls. Other bedrock formations in the area include Onondaga limestone which extends from the City of Buffalo to Tonawanda. Akron Dolomite and Bertie Limestone formations are also found in a narrow strip just north of the Onondaga limestone. Camillus shale, Syracuse formation and Vernon shale are other bedrock types found from the Town of Tonawanda to the Town of Wheatfield, including
CHAPTER 6: GEIS

Grand Island. Lockport Dolomite is found from the City of Niagara Falls to Lewiston and is the hard bedrock material that forms the Niagara Escarpment.

**Surficial Deposits** - The surficial deposits throughout the Buffalo and Niagara Falls region can be classified according to the physiographic province of the area. This area includes the Erie Lowlands, which border and are part of the Lake Erie basin at its lowest elevations; and the Ontario Lowlands, which occupy the area south of the Lake Ontario basin.

The Erie lowlands consist of both glacially-derived deposits, such as glacial till (as terminal moraines and ground moraines), granular deposits (as kames, glacial outwash and beach ridges) and glaciolacustrine deposits (as varved silt, clay and fine sand deposits), as well as recent deposits consisting of river and stream alluvium, and recent lake and beach deposits. The majority of the Erie Lowlands are underlain by glaciolacustrine (lake) deposits comprised of silt and clay. A persistent, linear beach ridge is also present as the southeast border of the lake deposits and represents the ancient shorelines of glacial lakes which formerly occupied the Lake Erie basin. This southwest-northeast trending ridge actually consists of two parallel ridges from the State line northeast to Cattaraugus County. At this point, the two ridges coalesce to become one ridge that continues on to the northeast and "inland" all the way to the vicinity of Alden in Erie County. Bedrock is exposed within some of the major southeast to northwest flowing streams that discharge into Lake Erie, such as along Cattaraugus Creek, Silver Creek, Chautauqua Creek and Twenty Mile Creek, as well as in bordering or flanking upland areas near Irving and Silver Creek extending into southern Erie County.

The Ontario Lowlands consist primarily of glaciolacustrine lake silts, clays and fine sands, with major areas overlain by glacial till or ground moraines. The province also contains several notable east-west oriented linear surficial deposits consisting of either moraines (glacial ice-front deposits) or beach ridge deposits. One prominent terminal moraine runs across the Western Region, from the Niagara River near Lewiston Heights, eastward to Lockport and into Orleans County. Similarly, a prominent beach ridge runs east, from a point opposite Queenston in Canada, to the eastern end of Orleans County.

Minor deposits of sand and gravel are found in localized, glacially-related ice contact and outwash deposits. Recent sand and gravel deposits are found as alluvium in many major stream valleys.

**Soils**

The soil composition along the Niagara River consists of a variety of soil types, some of which exhibit hydric or partially hydric properties. The northern portion of the Greenway area from Lewiston to Niagara Falls consists of soils in the Hudson-Rhinbeck Collamer series. Heading further south to the City of Niagara Falls, Wheatfield and the Tonawandas, the area consists of soils in the Urban Land category as well as units of the Howard, Niagara, Niagara-Canandaigua and Collamer soil series. The Erie County portion of the Greenway from Buffalo to the Town of Tonawanda consists of a variety of Urban Land soil complexes. Smooth gravel fill is found along the riverfront in these areas. Several locations along the Niagara River have been filled and graded and currently contain manmade fill. Smooth gravel fill (Udorthents) is present along the entire Niagara River shoreline of the City of Tonawanda. The majority of this fill is located at the...
northern tip of the City at the mouth of Tonawanda Creek. The south tip of Squaw Island, the northern tip of Grand Island in Buckhorn Island State Park and the portions of Beaver Island State Park located at the southern end of Grand Island also contain gravel deposits, although the majority of soil on the island consists of various poorly drained clay soils exhibiting hydric properties. The soils found near the river on Grand Island are more varied. The most abundant soils in this area are Raynham silt loam and Schoharie silt loam.

Many of the soils in the inland areas not immediately adjacent to Lake Erie or the Niagara River tend to be well drained with slopes ranging from 0 to 25 percent and a depth to bedrock of greater than 60 inches. Soils directly adjacent to Lake Erie and the Niagara River tend to exhibit different properties and have moderate to high susceptibility to water erosion and low susceptibility to wind erosion. These soils also tend to have a higher potential for surface runoff. On Grand Island, soil complexes vary in susceptibility to erosion. None of the soils identified in Niagara and Erie Counties are subject to wind erosion due to the coarse fragments on the surface or because of surface wetness.

**Topography**

The topography of the land adjacent to the Niagara River is relatively flat, except for the Niagara Gorge and the Niagara Escarpment. The flat land corresponds to the urban land use pattern that is present along the upper Niagara River from Buffalo through the City of North Tonawanda and the City of Niagara Falls. The steepest slopes are found from Niagara Falls to Lewiston along the Niagara Gorge and edges of the Lower Niagara River. The Niagara Escarpment forms an area of steep slopes south of the Village of Lewiston, and reduces in elevation to northern Lewiston and Porter, where the topography returns to a relatively flat expanse.

Lake Erie’s ordinary high water elevation is 573.4 feet based on the International Great Lakes Datum (IGLD). Lake Erie drains into the Niagara River which falls 14 feet in elevation before it reaches the brink of Niagara Falls. At Niagara Falls, the Niagara River descends 212 feet in elevation where it travels northward toward Lake Ontario via the deeply incised rock channel of the Niagara Gorge. From the base of Niagara Falls, the lower Niagara River descends another 95 feet before reaching Lake Ontario. Lake Ontario is at an elevation of 247.3 feet, IGLD.

**8A. Impacts to Geology, Soils and Topography** - Implementation of the Greenway Plan will not result in any impacts to geologic resources, soils or topography in the project area. Minor soil erosion may occur during construction of projects and activities funded under the direction of the Greenway Plan (i.e. trails, wetland enhancements, etc), however these impacts are considered temporary and minor, and can be avoided or mitigated via typical soil erosion and sedimentation control measures during ground disturbance and construction activities. Implementation of those portions of the plan that target corrective measures for erodible shorelines will reduce erosion, sedimentation and turbidity providing incremental improvements in overall water quality and habitat value.

**8B. Mitigation Measures** - Since the adoption and implementation of the Greenway Plan will not result in significant adverse impacts to soils, geology or topography, no mitigation measures are necessary. For individual projects, Best Management Practices will be followed for all construction and ground disturbing activities in order to avoid or minimize soil erosion.
Mitigation of short term construction impacts would be accomplished through adherence to DEC’s stormwater management and erosion and sediment controls.

9. Water Resources

The Niagara River is the main outlet for Lake Erie and four other Great Lakes. The river flows roughly 37 miles before entering Lake Ontario. The Niagara River has an average flow of 212,300 cubic feet/second, providing 83% of Lake Ontario’s tributary flow. Flow rate ranges from 4 to 8 miles per hour (FERC 2006). Although water resources in the Niagara River are influenced by drainage and surface water discharges from both the US and Canadian side of the border, this Generic EIS focuses on water resources on the US side of the border.

In the United States, the federal and state government separates various watersheds into Hydrologic Unit Codes (HUCs). These HUCs provide a geographic categorization of various water resources into hydrologic units. The main HUC for the river, Lake Erie, drains an area of approximately 263,700 square miles. The other HUCs that drain into the Niagara River from the US side of the border include Buffalo-Eighteenmile and the Niagara (Tonawanda Creek and surrounding tributaries). The Buffalo-Eighteenmile HUC drains the land areas in New York State in the vicinity of the city of Buffalo (Buffalo River) and southern Erie County (Eighteenmile Creek). The major tributaries include Buffalo River and its major tributaries, Cazenovia and Cayuga Creeks, Smokes Creek (south of the Buffalo Outer Harbor) and Scajaquada Creek (in the northern portion of the HUC). The Niagara HUC drains the city of Niagara Falls and the surrounding areas, and includes the following major tributaries: Tonawanda Creek/Erie Canal, Cayuga Creek, Gill Creek, and Fish Creek.

Groundwater

The principal aquifer that is located along the Niagara River is the New York and New England carbonate rock aquifer. This aquifer exists within the boundaries of the City of Buffalo and extends from the Town of Wheatfield to southern Lewiston. The three bedrock aquifers located within the principal aquifer are the limestone aquifer occurring in the Onondaga Limestone, the Akron Dolomite, and the Bertie Limestone; Camillus aquifer occurring in the Camillus Shale formation, the Syracuse Formation, and the Vernon Shale; and the Lockport aquifer occurring in the Lockport Dolomite. In general these aquifers only yield small to moderate quantities of water, and are not used for significant water withdrawals, particularly within the Greenway boundary, since the Niagara River provides an abundant surface supply.

Surface Water

As mentioned above, there are three main watersheds (hydrologic units) included in the Greenway. Surface waters within the project area include flowing and non-flowing systems. Primary surface water resources include Lake Erie, the Niagara River, the Black Rock Canal which is the receiving water body for drainage from Scajaquada Creek, Buffalo River, Tonawanda Creek, Lake Ontario and intermittent drainages (see Figure 5).

NYSDEC classifies all larger surface waters of the state to assist in water quality management. This classification scheme is based on physical, chemical, and biological characteristics that take into account economic and social considerations (NYSDEC 2004). The main classifications of
CHAPTER 6: GEIS

waters in the Greenway include: Class A waters (waters that serve as a source of water supply for drinking or food processing purposes, contact recreation, and fishing), Class B waters (waters that serve as contact recreation and fishing), and Class C waters (waters that serve as a location fish and have the potential for some contact recreation). In addition, if waters support various species of trout, or support trout reproduction, they are given an additional t or ts, respectively, in their classification.

In addition, to satisfy Clean Water Act (CWA) requirements, the NYSDEC Division of Water released a 2004 summary of the public health of waters in New York State (NYSDEC 2004). This report provides a list of the waters that are on the Priority Waterbodies List in the Niagara River/Lake Erie Basin. About one-fourth of the waters are listed as either not supporting intended-uses or having minor impacts or threats to water quality and 16% are considered Impaired, which frequently do not support appropriate uses. The majority of the shorelines of Lake Erie, Lake Ontario and the Niagara River located within the Greenway are considered Impaired, due to toxic/contaminated sediments. There are no waters within the Greenway that are considered Precluded, which are waters which do not support appropriate uses. In some instances, there is insufficient data to characterize the impairments of a waterbody; in those instances, the waterbody is listed as needs verification.

There are 24 permitted stormwater discharge points along the Niagara River, Little Niagara River (the Niagara River portion on the north side of Cayuga Island) and the Cayuga Creek. These discharges often contain outflows that are a combination of stormwater and raw sewage overflow that may or not be functioning under the terms and conditions of a discharge permit. Seventeen discharge points are associated with the City of Niagara Falls.

Major surface water bodies and streams along the US side of the Niagara River include:

- **Lewiston Power Reservoir** - The Lewiston Power Reservoir is an artificial reservoir located in the Town of Lewiston. The reservoir is supplied by two water intakes located in the City of Niagara Falls on the upper Niagara River. The water enters the Lewiston Pump Generating Plant and is released into the Forebay that feeds the Robert Moses Niagara Power Plant. The Robert Moses Niagara Power Plant uses the water to generate power and is returned to the lower Niagara River, 4.5 miles downriver from Niagara Falls.

- **Ellicott Creek** - Ellicott Creek is tributary to Tonawanda Creek and then the Niagara River. It originates in Genesee County and flows through northern Erie County. The creek joins Tonawanda Creek and the Erie Canal and empties into the upper Niagara River forming the boundary between Erie and Niagara Counties. The lower reach of Ellicott Creek is classified as Class B waters, by the NYSDEC, at the mouth where it enters Tonawanda Creek. The NYSDEC has designated the lower portion of Ellicott creek as Impaired waters, which are those that frequently do not support appropriate uses. The upper reach of Ellicott creek is classified as Class C waters and the water quality is being verified by the NYSDEC.

- **Niagara River/Black Rock Canal** - The Niagara River conveys flow from Lake Erie to Lake Ontario and is approximately 37 miles in length. The Black Rock Canal was built along the east bank (right descending bank) of the Niagara River for the purpose of providing safe navigation around the rapid near the present day Peace Bridge, and extends from the Buffalo...
CHAPTER 6: GEIS

Outer Harbor for 3.5 miles to the northern end of Squaw Island. The canal is defined by the eastern shoreline of the Niagara River and a break wall, which runs roughly parallel to the shoreline. The northern terminus of the Black Rock Canal ends at the Black Rock Lock which is operated and maintained by the US Army Corps of Engineers. The canal receives inflow from the Buffalo River, numerous stormwater outfalls and all of the drainage from Scajaquada Creek. This Class C waterbody is listed as impaired for metals, but is listed as being verified by the NYSDEC (NYSDEC 2004).

- **Buffalo River** - The Buffalo River empties into Lake Erie at the head of the Niagara River. Its watershed drains an area of 446 square miles in the counties of Erie, Genesee, and Wyoming. The main stem of the river is approximately 8.5 miles in length and extends from the mouth of Cayuga Creek to the confluence with Lake Erie. Water from the Buffalo River directly enters the Niagara River and the Black Rock Canal. The Buffalo River is classified as Class C waters, by the NYSDEC. Based on the magnitude of the flow of the Niagara River, the discharge from the Buffalo River is insignificant. However, the Buffalo River is a source of contaminants. The lower 6 miles of the river, including the City Ship Canal and the lower portion of Cazenovia Creek are classified by the USEPA as one of the 43 Great Lakes Areas of Concern (AOC); areas that are severely degraded geographic areas in the Great Lakes Basin (USEPA 2006). The NYSDEC also rates the Buffalo River as an Impaired waterway, that frequently does not support appropriate uses. The Buffalo River and its sediments have been impaired by inputs from inactive hazardous waste sites, combined sewer overflows (CSOs) and other point and nonpoint sources of pollution. The major sources of contamination in the Buffalo River AOC include contaminated bottom sediments and non-point source pollution (Niagara Riverkeeper 2006); contaminants of concern include: PCBs, PAHs, heavy metals, and industrial organics.

- **Tonawanda Creek** - Tonawanda Creek is a major tributary of the Niagara River. The creek meanders for over 90 miles and drains nearly 650 square miles of land in five counties. It is classified as Class C waters, by the NYSDEC, where it enters the Niagara River. The waters of this creek are considered best suited for fishing and supporting recreational uses, fish propagation and survival, but other factors limit their use for these purposes. The NYSDEC has determined that the lower reach of the Tonawanda Creek is considered Impaired and frequently does not support appropriate uses. The lower middle segment of the creek has only minor impacts to water quality. However, the upper reaches of Tonawanda Creek located in Genesee County are also considered Impaired.

- **Niagara River** - The Niagara River, approximately 37 miles in length, and consists of an upper river segment and a lower river segment divided by Niagara Falls. The upper Niagara River extends 22.5 miles before reaching Niagara Falls. The section between Lake Erie and Grand Island is deep exhibiting depths greater than 20 feet and a substantial current. At Grand Island the river divides into two channels before reuniting at the Chippewa-Grass Island Pool located at the north end of Grand Island that leads to Niagara Falls. The lower river extends from the Niagara Falls to Lake Ontario, a distance of approximately 15 miles. The Niagara Gorge portion of the lower river is a mix of rapids and turbulent pools which range in depth from 35 to 200 feet (FERC 2006). From the Robert Moses Power Project to Lake Ontario the river varies in depth from less than 20 feet to a range of 30 to 150 feet in the center of the channel. The NYSDEC has determined that the entire length of the Niagara
CHAPTER 6: GEIS

River is considered Impaired, due to chemical contamination. PCB and dioxin contamination is reported to be the cause of the majority of the contamination in this reach; however additional chemicals such as Mirex and chlordane are also contributing factors.

The main channel portion of the Niagara River does not contain substantial deposits of the fine-grained sediments, since the high water velocities and water volumes result in a predominately scoured channel of bedrock and boulders, and gravels in slower velocity areas. The majority of the fine sediments (and locations of contaminated sediments) exist in localized sediment pockets at certain tributary mouths and nearshore areas, where slow water conditions exist and fine sediments accumulate. There is a known presence of contaminated sediment pockets which are contributing to a degradation of benthos use impairment at these areas. The USEPA and NYSDEC have identified contaminated sediments in three embayment areas namely the mouth of the Pettit Flume, 102nd Street embayment and the mouth of Gill Creek (USEPA 2006). In addition, sediment from Buffalo Harbor, the Black Rock Canal, the Riverside nearshore area, Tonawanda Channel nearshore area, Wheatfield nearshore area and the Lower Niagara River nearshore are known to contain a wide variety of organic and inorganic contaminants.

Major surface water bodies and streams along the Canadian side of the border include Lyons Creek, Ussher’s Creek, Black Creek, and Frenchman’s Creek.

Floodplains

Flooding is common along many of the region’s rivers and streams. The 100-year floodplain has been mapped for every river and stream in the region and can be found along the courses of tributaries at the northern and southern tips of Grand Island, and where the Buffalo River and Tonawanda Creek flow into Lake Erie. Large areas along the eastern segment of Tonawanda Creek are particularly prone to flooding. The existence of fluctuating water levels can be beneficial for preservation of riparian corridors, wetlands and sensitive habitats since they pose a significant constraint to development. Excessive rates of surface stormwater runoff, sediment from agriculture and construction, and the loss of vegetation pose additional threats for increased river and stream bank erosion, as well as downstream flooding potential. Figure 58 shows areas that are located within and outside of the 100-year and 500-year floodplains.

9A. Impacts to Water Resources - Implementation of the Greenway Plan will not result in any impacts to groundwater resources. Beneficial impacts to surface water resources and quality along the Niagara River are expected to result from implementation of the Greenway Plan. Funding that will be used to correct Combined Sewer Overflow (CSO) problems, eliminate or minimize point source discharges of contaminants, address issues of non-point source runoff into Niagara River or its tributaries, or that enhance the function and value of wetlands and wetland complexes would all have beneficial impacts to surface water resources. Beneficial impacts of any individual project may vary and will be dependent upon the magnitude of the problem and achieving the desired result. However, cumulative impacts of multiple projects over several years will result in significant positive impacts to water resources and quality.

Implementation of the Greenway Plan is not expected to have significant adverse impacts to floodplains. Individual projects may be located in floodplains due to the nature of the waterfront
CHAPTER 6: GEIS

area; however uses such as passive recreation will have no significant impact on the function of floodplain systems. In many cases active floodplains may be targeted for preservation since there continued existence with shield downstream properties from excessive damage due to flooding. If structures are necessary within floodplain areas conventional flood proofing measures will be incorporated into projects to protect property and to ensure continued function of the floodplain. The optimal approach is to ensure that permanent structures are not placed within designated 100-year floodplains of the Niagara River or its tributaries.

9B. Mitigation Measures - Since the adoption and implementation of the Greenway Plan will not result in any significant adverse to water resources, no mitigation measures are necessary. However, mitigation of short term impacts due to site-specific construction and potential project-related erosion, would be accomplished through adherence to Best Management Practices and adherence to such guidelines as DEC’s stormwater management and erosion and sediment controls.

10. Wetlands

Wetlands are defined as lands where the saturation with water dictates the nature of the soil development and types of plant and animal communities on its surface (Cowardin 1979). Wetlands in New York State are regulated by the United States Army Corps of Engineers (USACE) and NYSDEC, depending upon the size and conditions of the specific wetland (see below for additional discussion). Wetlands are important to the environment because they improve water quality to surface (and ground) waters; maintain a more natural water quantity/hydrology relationship in watersheds; and provide a variety of wildlife habitats. Water quality improvements occur in wetlands as water passes through wetlands or is temporarily stored there, and sediments, nutrients, and potentially contaminants are removed from surface flow. Wetlands also provide a more natural hydrologic cycle by reducing peak flows during storm events, potentially decreasing downstream erosion, and providing for groundwater recharge in areas with favorable geology. In addition, wetlands provide a wide range of fish and wildlife habitats, and in some instances provide habitat for threatened or endangered plant or animal species.

Wetlands in the Niagara River corridor are subject to regulation by the USACE pursuant to Section 404 of the Clean Water Act and the NYSDEC under Article 24 of New York State Conservation Law. All wetlands regardless of size are regulated at the federal level. Federal wetlands are defined on the basis of three criteria namely vegetation, soils, and hydrology. When all three of these parameters are met the wetland is subject to federal regulation. New York State uses the same criteria as the federal process, but only regulates wetlands that are greater than 12.4 acres in size or are of significance in their local setting.

Several sources were used to assess the potential for wetland occurrence within the Greenway, including National Wetland Inventory (NWI) maps, NYSDEC Freshwater Wetlands maps (see Figure 5), hydric soil maps for Erie and Niagara Counties (see Figure 59), and aerial photographs of the Greenway.
CHAPTER 6: GEIS

Federally Regulated Wetlands

NWI maps are often used as a tool for the preliminary screening of wetland sites. However, this mapping system cannot be used to precisely locate the limits of wetlands that are subject to regulation by the U.S. Army Corps of Engineers (COE). The majority of mapped NWI wetlands occurs along and adjacent to the Niagara River waterfront. The river shoreline in Erie County and southern Niagara County has undergone considerable modification as a result of suburban and urban land uses, development of transportation infrastructure and the filling and bulkheading of riverfront property. While historically abundant, wetland resources within the Niagara River corridor have diminished significantly. A total of 107 wetland types were identified within the Greenway and include a mixture of palustrine emergent marshland, forested wetland, and scrub-shrub habitat. The forested/scrub-shrub wetlands habitat type was identified as being the most abundant wetland type within the Niagara River corridor. In addition, the NWI also identified 39 types of freshwater ponds, riverine, lake and wetland areas within the corridor.

To determine the location of federally regulated wetlands, a site-specific delineation must be conducted. Under this procedure, plant cover, soils and hydrologic characteristics are assessed and from these data a boundary line is drawn. The placement of dredged or fill material in wetlands cannot take place without authorization by the COE. The COE must apply specific guidelines and conduct a public interest review to determine if a permit should be issued for the filling of wetlands. In most cases developers are compelled to reduce or eliminate wetland impacts and in some cases permit requests are denied.

New York State Regulated Wetlands

The NYSDEC designates wetlands as Class I, II, or III. Class I wetlands merit the highest level of protection. Class II wetlands provide important wetland benefits, the loss of which is acceptable only in very limited circumstances. Class III wetlands supply wetland benefits, the loss of which is acceptable only after the exercise of caution and discernment. Impacts on these wetlands are permitted only if it is determined that the proposed activity satisfies a pressing economic or social need that clearly outweighs the loss of or detriment to the benefit(s) of the Class II or Class III wetland. Class II and III wetlands act as pollution or flood buffers and may provide habitat for endangered, threatened, or vulnerable species.

The NYSDEC Freshwater Wetlands maps depict the regulated wetlands within the Town of Grand Island, Town of Tonawanda, City of Tonawanda and the Town of Wheatfield. These wetlands are designated as Class I, II and III, of which Class II wetlands are the most abundant.

Unmapped Wetlands

Another way to identify potential wetland sites is to use the soils maps contained in the County Soil Surveys published by the Natural Resource Conservation Service. Since wetlands are often defined by the presence of saturated or hydric soils and related plant communities and hydrology are often associated with these soils, it is reasonable to use mapped hydric soils as a screening tool for regulated wetlands at the Federal and State levels. However, this method is not all encompassing and wetlands can occur in areas outside the mapped hydric soil units. Wetlands can also occur in areas not mapped as such by the NWI or the NYSDEC.
CHAPTER 6: GEIS

The soils maps indicate that the majority of the hydric soils present in the Greenway are located in the Town of Wheatfield, Town of Grand Island and the northern portion of the City of North Tonawanda. Areas further away from the river corridor in the City of Niagara Falls, Town of Lewiston and Town of Porter also contain scattered areas of hydric soil. A majority of the Greenway in Erie County and southern Niagara County is underlain by urban land that is defined as land in which 60 to 80% or greater of the surface is covered by asphalt, concrete, buildings, or other structures thus limiting the areas where hydric soils could occur.

Unique Wetland Areas

- **Riverfront Park** - Riverfront Park is located on the Niagara River in the Town of Tonawanda, just north of the Grand Island Bridge. The park’s shoreline is 2,200 feet in length, extending from the foot of the South Grand Island Bridge to the industrial property just south of Isle View Park. The park consists of 19.7 acres of riparian habitat that includes a mixture of forested wetlands and floodplain forest habitat and historically was a part of the Erie Barge Canal. The Erie County Riverwalk linear park follows the eastern perimeter of this parcel and includes a spur that gives the public direct access to the Niagara River waterfront.

- **Spicer Creek** - A tributary of the Niagara River, Spicer Creek empties into the east channel of the Niagara River on the east side of Grand Island. The creek is slow and meandering with depths less than 6 feet and a heavily silted and debris laden bottom. The upper reaches of the creek are ephemeral while perennial stream conditions persist in the lower reach that empties into the Niagara River. At the creek outlet there is an extensive emergent wetland and forested wetland complex. A portion of this area comprising about 16 acres has been acquired by the New York State Department of Environmental Conservation while a larger adjacent tract just downstream is owned by the Town of Grand Island. Historically, wetlands in this area extended well into the Niagara River, but erosion caused by fluctuating water levels and boat traffic has significantly reduced their size. The shallows just offshore of the mouth of Spicer Creek are littered with the remains of old wharves and barges; and the river bottom sediments in this area are in a constant state of suspension precluding the establishment of stabilizing submerged aquatic plant beds that are typical elsewhere in the upper river.

- **Cherry Farm Park** - Cherry Farm Park is located on the Niagara River in the Town of Tonawanda, south of the Grand Island Bridge. The park consists of 53.5 acres of land including an 18-acre wetland, 2,550 feet of shoreline, a restored section of the Erie Canal and a section of the Riverwalk linear park. This parcel is a former landfill that was remediated several years ago. Wastes on the site were consolidated and capped and drainage from this area is collected and treated in accordance with regulatory requirements. Due to the need to protect the landfill cap, future use of the site will be limited to passive recreational activities.

- **Grand Island Tributaries** - The Grand Island Tributaries include portions of four major tributary streams and their associated wetlands on Grand Island. The Grand Island tributary streams on Grand Island and their associated wetlands include Woods Creek, Gun Creek, and Big Sixmile Creek. All of these watercourses are slow, meandering, and less than 6 feet in
CHAPTER 6: GEIS

depth, with heavily silted and debris-strewn bottoms. Portions of these tributaries are intermittent while the lower reaches exhibit flow rates that are nearly undetectable except during periods of heavy runoff.

- **Beaver Island Wetlands** - This site is located at the southernmost tip of Grand Island at the west channel of the Niagara River. This area comprises about 10 acres and is located wholly within Beaver Island State Park. The wetland contains some high quality aquatic beds and a species of iris that is not common to the western New York area. A narrow corridor of riparian habitat exists along the northern border of this wetland that has been enhanced by the addition of wildlife plantings and the use of environmentally compatible mowing practices. However, grass is mowed nearly to the water’s edge along the south side of this area reducing its value to some degree. The adjacent upland to the south of this site is a designated Habitat Improvement Project that will be funded as a result of the Relicensing settlement with the New York Power Authority.

- **Buckhorn Island** - Buckhorn Island wetlands are located in Buckhorn Island State Park, at the northern end of the Town of Grand Island. The Buckhorn Island Wetlands area comprises the largest coastal wetland complex in western New York. This 500-acre area is comprised of emergent marsh and deciduous forested wetlands, associated with Burnt Ship Creek and Woods Creek. A large, shoal area containing beds of submersed and emergent aquatic vegetation lies offshore of the mouth of Woods Creek.

  Burnt Ship Creek is a very shallow backwater channel of the Niagara River, bordered by a dense stand of cattail. Woods Creek, the largest tributary on Grand Island, is a relatively broad, deep channel, exhibiting slow to moderate flows. The creek is bordered by a broad area of sedges, rushes, and grasses. Also included in the habitat unit is a relatively large, shoal area containing beds of submersed aquatic vegetation that lies between Burnt Ship Creek and Navy Island. Buckhorn Island Wetlands is located in Buckhorn Island State Park, at the northern end of the Town of Grand Island. The Buckhorn Island Wetlands area comprises the largest coastal wetland complex in western New York. This 500-acre area is comprised of emergent marsh and deciduous forested wetlands, associated with Burnt Ship Creek and Woods Creek. A large, shoal area containing beds of submersed and emergent aquatic vegetation lies offshore of the mouth of Woods Creek.

- **Strawberry Island and Motor Island** - This island complex is located in the upper Niagara River, near the southern tip of Grand Island and includes approximately 400 acres of riverbottom that supports a diverse system of submersed aquatic plant life. The shoal areas around the islands contain areas of emergent and submersed vegetation. Strawberry Island is a horseshoe-shaped island approximately 20 acres in size that contains a mixture of woodlands, emergent marshes and submerged plant beds. Strawberry Island-Motor Island is a state-designated Significant Coastal Fish and Wildlife Habitat. The area is discussed in additional detail later in this Section.

10A. **Impacts to Wetlands** - Implementation of the Greenway Plan is anticipated to beneficially impact wetlands, both on a system-wide basis throughout the Niagara River and on specific sites that can achieve their full biological potential with the application of enhancement or restoration measures using Greenway funding. Many wetlands have been impaired, filled or
CHAPTER 6: GEIS

have declined in value as a result of human intrusion and/or encroachment. The use of Greenway funds to protect, preserve, or restore impaired wetlands will restore their functions and values to their full potential and in turn will result in significant long-term beneficial impacts.

Although the actual amount of wetland area to be protected or restored under the Greenway Plan is not known with certainty at this time, it is clear that the opportunity exists to realize some dramatic and significant improvements in wetland resources along the entire Niagara River. Wetlands that will benefit from this program include those along the Niagara River itself, as well as those found along tributary corridors. The extent of positive impact also will be determined by the level of wetland degradation that has occurred, and the effectiveness and sustainability of proposed rehabilitation and restoration measures.

It is possible that site-specific and relatively minor adverse impacts may occur in wetlands areas along the Niagara River as a result of the construction and operation of some facilities relating to other aspects of the Greenway Plan. For example, completion of a trail linkage connecting two trails may require that a small area of wetland be impacted. Or, remediation of a brownfield area may result in grading or soil removal in areas currently classified as wetland. All such instances are expected to be minor and localized, and could easily be mitigated.

10B. Mitigation Measures - Potential adverse impacts to wetland resources will be evaluated on a project-specific basis and will be mitigated by appropriate delineations, avoidance or mitigation as negotiated in the NYSDEC/USACE permitting process. In addition, mitigation of short term impacts due to site-specific construction and potential project-related erosion would be accomplished through adherence to Best Management Practices and adherence to such guidelines as DEC’s stormwater management and erosion and sediment controls.

11. Terrestrial and Aquatic Ecology

The ecological resources described in this section include the terrestrial and aquatic environments of the Niagara River Greenway. Vegetation and wildlife resources in this area are characteristic of the Erie-Ontario Lake Plain Ecoregion. The Niagara Region is largely formed of glacial till, which affects the development of existing biological resources, as well as the influence of human settlement in the area.

Terrestrial Environment

The terrestrial environment of the Niagara River Greenway comprises a variety of ecological communities characteristic of northern successional systems. During the terrestrial habitat mapping work associated with the relicensing of the Niagara Power Project, a total of 23 ecological communities within four subsystems were identified, including: open uplands, barrens and woodlands, forested uplands, and terrestrial cultural lands (FERC 2006). The majority of the undeveloped lands are the open upland and forested upland, characterized by successional communities. Some of the most unique terrestrial communities consist of the limestone woodland, calcareous cliff, and talus slope communities of the Niagara River Gorge along the Lower Niagara River.

As discussed, the majority of the land use in Upper Niagara River is characterized by urban, transportation, or industrial development. Consequently, the remnant undeveloped areas have
CHAPTER 6: GEIS

been influenced by past disturbance and typically have successional vegetation communities. In some areas there are patches of more undisturbed habitats, including beach maple mesic forests and oak hickory communities. Wildlife that inhabit these areas include whitetail deer, Eastern cottontail rabbit, grey squirrel, woodchuck, and wild turkey. In addition, based on the location and physical conditions of the Niagara River, other wildlife species include water-dependent bird species which use the Niagara River as a migratory corridor and/or staging area, a breeding area, or a wintering area.

The Niagara River corridor has been designated as a globally significant, binational Important Bird Area (IBA). The IBA program is a global initiative coordinated by BirdLife International to identify and conserve sites important to bird species worldwide. The IBA program is implemented at the provincial level in Canada and by the National Audubon Society in the United States.

The Niagara River Corridor IBA encompasses the majority of the Greenway, extending 37 miles throughout the length of the Upper and Lower Niagara River and inland, east and west of the Niagara River. A primary use zone (areas within 3.5 miles of either side of the Niagara River) has been identified by the IBA working group as having significant concentrations of use by the IBA species at and near the river. A secondary use zone includes areas of additional use and/or influence areas, which may extend for many miles on either side of the river and include areas such as sanitary landfills or possible roosting and/or nesting sites. The Niagara River corridor is recognized as important primarily for the large concentrations of gulls and waterfowl that stage in the area during migration and as a wintering site. The four species that are found in this IBA in globally significant numbers include: Bonaparte’s gull, herring gull, canvasback, and common merganser. Numerous other water-dependent bird species, including colonial waterbirds, primarily herons and egrets, are found along the Niagara River corridor; and other avian species utilize the river as a migration corridor. In addition, a significant heron rookery is located on Motor Island, which provides a large wooded island habitat in the river for herons and it contains the only great egret nesting colony in upstate New York.

Several state- or provincially-listed threatened and endangered bird species are identified in the Greenway area. These include the pied-billed grebe, least bittern, black tern, common tern, bald eagle, peregrine falcon, northern harrier, and sedge wren. Bald eagles have been regularly observed along the Niagara River during winter months for a number of years and a pair nested on Navy Island in 2005 and 2006. Peregrine falcons have bred near Niagara Falls nearly annually since 1998. These birds were the first naturally established pair to breed in southern Ontario in over 50 years (Niagara River Corridor IBA Working Group 2002).

Table 9 below identifies the type of bird species found throughout the Niagara River Corridor, as provided by NYSDEC. The location of and types of bird species are described further in the discussion of Significant Coastal Fish and Wildlife Habitats.

### Aquatic Environment

The Niagara River watershed encompasses the Great Lakes region upstream and including Lake Erie, and accounts for approximately 83% of the flow into Lake Ontario. The location of the Niagara River and its tributaries in the Great Lakes ecosystem influences the availability and distribution of aquatic species within the Niagara River Greenway. Both the upper and lower Niagara River and some of their tributaries support self-sustaining warmwater and coolwater fisheries (e.g. fish that reside in warm water areas or cool water areas). A total of 92 fish species have been recorded from the Niagara River (FERC 2006). Typical fish species include: smallmouth bass, walleye, white bass, yellow perch, white sucker, muskellunge, northern pike, carp, various shiners, brown bullhead, bluegill, and rainbow smelt.

When discussing the aquatic environment, the mainstem Niagara River is typically separated into the Upper Niagara River and the Lower Niagara River, as the Niagara Falls represents a significant barrier to fish and other aquatic biota distribution. Accordingly, there are some noticeable differences in the fish community in the upstream and downstream sections of the river, most notably the presence of coldwater fish (e.g. trout or salmon). A put-and-take coldwater fishery exists in Lake Erie through stocking efforts in Lake Erie tributaries by the NYSDEC. None of these fish are stocked in the Upper Niagara River, but stocked individuals have the potential to drift or migrate into portions of the river. The NYSDEC stocks a variety of coldwater fish into the Lower Niagara River and the western basin of Lake Ontario, including steelhead, brown trout, chinook salmon, and coho salmon. These stocking efforts result in large migrations of these cold water fish into the Lower Niagara River during various times of the year.
CHAPTER 6: GEIS

These fishery resources are an important component to the recreational nature of the Niagara River.

While there are no federally listed species in the Niagara River, several state listed species occur throughout the river and have the potential to occur in some of the Niagara River tributaries. These include the state endangered silver chub; the state threatened lake sturgeon and the mooneye; and state species of special concern including the black redhorse sucker and the redfin shiner.

Numerous benthic macroinvertebrates are found in the river, with a range of species indicative of large river systems. Studies by the NYSDEC indicate that the species diversity and assemblage has increased since the 1970s indicating improved water quality (NYSDEC 1997). Native mussels are rare in the mainstem river, which may result from the presence of non-native zebra mussels and quagga mussels (FERC 2006). There are a few remnant populations of native mussels in a Grand Island tributary and in Buckhorn Island State Park that are state listed sensitive species (FERC 2006).

New York State Significant Coastal Fish and Wildlife Habitats

The New York State Department of State Division of Coastal Resources has designated significant coastal fish and wildlife habitats (SCFWH) throughout the State’s coastal areas. These areas have been identified as providing habitat diversity, a unique habitat type or support a concentration of wildlife species at certain times of year. There are 250 of these habitats throughout New York State, eleven of which are located within the Niagara River Greenway (see Figure 6). Each of the areas is listed below from south to north with a description of the location and associated unique features. A habitat narrative and map for all of the SCFWH areas follows.

- **Tifft Nature Preserve** - The Tifft Nature Preserve is located approximately three miles south of downtown Buffalo, in Erie County. It is a 264-acre nature preserve with an environmental education center, which contains a diversity of fish and wildlife habitats. Within the preserve area there is a 75-acre cattail marsh, several small freshwater ponds, remnants of an old canal, old fields, forested wetlands, and a shrub-sapling successional area. The wetlands in this area are relatively undisturbed even though they occupy lands that were extensively disturbed historically. This urban wetland is the largest of its kind along the Lake Erie shoreline. Active and vacant industrial facilities and railroad properties surround the preserve.

  The area is used as a stopover during spring and fall migrations by many species of waterfowl, shorebirds, herons, osprey, and passerine birds. Other wildlife use the preserve year round, including: muskrat, mink, raccoon, eastern cottontail, red fox, gray fox, meadow vole, common garter snake, northern water snake, snapping and painted turtles, bullfrog, green frog, northern leopard frog, and Jefferson salamander. Tifft also contains a population of burrowing crayfish one of only three known localities for this species in New York State. The freshwater ponds in the preserve contain many warm water fish species including black crappie, yellow perch, rock bass, pumpkinseed sunfish, bluegill, bullhead, carp, largemouth bass, gizzard shad, freshwater drum, northern pike, and longnose gar.
CHAPTER 6: GEIS

- **Times Beach Nature Preserve (Diked Disposal Site)** - Times Beach is located within the City of Buffalo just south of the Buffalo River, on the Buffalo Harbor waterfront. This approximate 55-acre area is a man-made, partially filled and diked dredge spoil disposal area that is a currently designated wildlife preserve. Times Beach contains several distinct physical zones, including: a deep water zone, a low-lying mud or silt flat zone, a gradually sloping shallow water zone and an upland zone. The lake side is surrounded by porous stone dikes, while the upland a portion of the habitat is bordered by the U.S. Coast Guard base, a marina, abandoned industrial developments, the ice boom storage area, port facilities and the Furhman Boulevard bicycle and pedestrian trail.

The Times Beach dredged material diked disposal site is one of the few sizeable wetland areas along the New York shoreline of Lake Erie. In addition to its location on an important migratory flyway it is a significant fish and wildlife habitat. Times Beach is an important resting and feeding area for gulls, terns, shorebirds, dabbling and diving waterfowl, marsh birds, and passerines during spring and fall migrations. Many birds use this area during the breeding season including: mallard, American wigeon, ring-billed gull, common tern, least bittern, Virginia rail, sora, common moorhen, ring-necked pheasant, killdeer, spotted sandpiper, belted kingfisher, and red-winged blackbird. Many uncommon and rare birds have been observed at this location. Other wildlife found in the area include: the muskrat, raccoon, eastern cottontail, several smaller mammals, common garter snake and bullfrog.

- **Small Boat Harbor – Buffalo** - The Small Boat Harbor is located on the shoreline of Lake Erie in City of Buffalo, Erie County. This approximate 165-acre fish and wildlife habitat is located in a relatively shallow water area of Buffalo Harbor that is protected by a rock rubble mound breakwater and the perimeter of an old dredged material disposal site. The area has undergone extensive disturbance as a result of past waterfront industrial uses. The west side of the small boat harbor is open to the waters of the Buffalo Outer Harbor that includes a maintained deep draft navigation channel. Heavily used, the small craft harbor includes docks, launch ramps, and other marina support services. During the winter months this area is frequented by ice fishermen.

The Small Boat Harbor is one of the most important fish and wildlife habitat areas in the Buffalo metropolitan region because it provides substantial protection from wave action for fish, wildlife, and supports an extensive bed of aquatic vegetation. As a result, the harbor supports a highly productive and diverse littoral community. The major adult fish found in the area include: pumpkinseed, yellow perch, brown bullhead, largemouth bass, muskellunge, carp, and freshwater drum. This is also a spawning location for centrarchids, shiners, yellow perch, carp and drum. In addition, the harbor supports a productive macrobenthic community, dominated by snails and clams. The Small Boat Harbor attracts concentrations of waterfowl and migratory birds during spring and fall migrations. The most abundant birds observed here during these periods are the diving ducks, including canvasback, scaups, mergansers, common goldeneye, bufflehead, along with mallard, Canada goose, loons, grebes, and gulls.

- **North Buffalo Harbor** - North Buffalo Harbor is located in the northeast corner of Lake Erie, at the head of the Niagara River, in the City of Buffalo, Erie County. The North Buffalo Harbor fish and wildlife habitat comprises an approximate 800-acre area of open water within the lake and upper river channel, extending roughly from the mouth of the Buffalo River to
CHAPTER 6: GEIS

the Peace Bridge. The eastern border of the North Buffalo Harbor fish and wildlife habitat is the Black Rock Canal, and immediately west are the Canadian waters of Lake Erie. North Buffalo Harbor supports some valuable fish and wildlife resources, despite the loss of fish and wildlife habitats in this area as a result of land development, dredging, storm protection projects, discharges of domestic and industrial wastes, and inflow of polluted upland runoff.

North Buffalo Harbor is one of the three major nesting areas of gulls and terns in western New York State. Gulls and terns nest in the cracks in concrete structures along the break walls and piers. The open water areas of the harbor are important for feeding and nesting terns, as well as wintering waterfowl. Waterfowl use this area during winter because the installation of the Lake Erie ice boom up river allows a large part of this area to remain free of ice. Concentrations of many waterfowl species, along with loons, grebes, gulls, and terns, occur in the North Buffalo Harbor during the spring and fall migration periods.

North Buffalo Harbor also supports a major urban fishery or regional significance. Predominant fish species occurring include rock bass, white bass, smallmouth bass, yellow perch, walleye, northern pike, muskellunge, brown trout and rainbow trout. No critical spawning or nursery areas have been documented in this area (NYSDOS 2004).

- **Strawberry Island and Motor Island Shallows** - This area is located in the upper Niagara River and is roughly bounded by Strawberry Island, Motor Island, and the southern tip of Grand Island. This approximate 400-acre area is located in the Town of Grand Island and Tonawanda, Erie County. This fish and wildlife habitat contains an extensive shallow shoal area that supports beds of submergent aquatic vegetation, and patches of emergent wetland vegetation in shoreline areas.

Strawberry Island - Motor Island Shallows is the largest area of riverine littoral zone in the Niagara River. Riverine littoral zones, which are rare in the Great Lakes plain ecological region, are extremely valuable fish and wildlife habitat. The shallows are one of the most productive fish spawning areas in the upper Niagara River for small mouth bass, yellow perch and various other resident freshwater fish species. One of two principal spawning grounds for muskellunge in the river is located within the shallows.

The Strawberry Island and Motor Island Shallows area is considered to be one of the most important waterfowl wintering areas in the northeastern United States. This area also serves as a major feeding and resting area for diving ducks, including, common mergansers, red-breasted mergansers, common goldeneye, canvasbacks, scaup, and bufflehead. Waterfowl use of the area during winter varies each year based on the extent of ice cover throughout the region. Concentrations of waterfowl also occur in the area during spring and fall migrations. Summer use of the area by wildlife is not known to be as significant.

- **Buckhorn Island Tern Colony** - Buckhorn Island Tern Colony is located at the northern tip of Grand Island, Erie County, and in the City of Niagara Falls, Niagara County. This fish and wildlife habitat consists of several man-made structures located within the Tonawanda Channel of the Niagara River, which consist of an approximate one-quarter mile long rock and boulder dike, and two transmission tower footings. These structures are isolated from the mainland, and are flat and gravelly, with little vegetation.
CHAPTER 6: GEIS

The Buckhorn Island Tern Colony encompasses a small group of man-made channel structures that do not represent an unusual ecosystem type, but provide valuable habitats for terns and gulls. These structures serve as a major nesting site for common terns, ring-billed gulls, and herring gulls. The gull and tern colonies present here are one of only three active gull and tern colonies in western New York. There are no significant human use activities associated with the Buckhorn Island Tern Colony (NYSDOS 2004).

**Buckhorn Island Wetlands** - This fish and wildlife habitat is located in Buckhorn Island State Park, at the northern end of the Town of Grand Island, Erie County. Covering approximately 500 acres, the area consists of emergent forested wetlands associated with Burnt Ship Creek and Woods Creek; and a large, shoal area containing beds of submergent aquatic vegetation. The land adjacent to this habitat consists of undeveloped forestland and fields in various stages of ecological succession.

The Buckhorn Island Wetlands area is the largest coastal wetland complex in western New York. The habitat includes the only undeveloped marsh of significance located on the river and a major riverine littoral zone (NYSDOS 2004). These wetlands serve as feeding, resting and breeding areas for ducks, herons, coots, moorhens, and rails. During spring and fall migrations considerable numbers of waterfowl also occur in the area. Other wildlife species in the Buckhorn Island Wetlands and Woods Creek and, to a lesser extent, Burnt Ship Creek, include muskrat, mink, raccoon, and white-tailed deer.

The creeks within this area provide extensive and valuable littoral habitat that is used by warmwater fish species of the Niagara River. Woods Creek contains significant concentrations of spawning northern pike from February through April, with many remaining until July. The littoral area between Burnt Ship Creek and Navy Island is a principal spawning ground for northern pike and muskellunge, and also one of the most productive smallmouth bass spawning areas in the upper Niagara River. Other warmwater fish present in the creeks include the yellow perch, black crappie, bullhead, rock bass, white sucker, and carp.

**Grand Island Tributaries** - The Grand Island Tributaries extend from the Tonawanda and Chippawa channels of the Niagara River into the Town of Grand Island, Erie County. Portions of four major tributary streams and their associated wetlands on Grand Island make up this fish and wildlife habitat. These streams include Woods Creek, Gun Creek, Spicer Creek, and Big Sixmile Creek, which are slow, meandering, and less than 6 feet deep, with heavily silted and debris-strewn bottoms. Also included in this habitat is a 10-acre wetland in Beaver Island State Park which opens directly into the Niagara River.

The Grand Island Tributaries are similar to the majority of Niagara County stream ecosystems, but are the least developed of those which drain into the Upper Niagara River. The five areas which comprise this habitat are an integral part of the upper Niagara River ecosystem and provide important spawning and nursery areas for warmwater fish species, especially northern pike. Locally significant use of these areas may occur, including nesting by mallard and wood ducks, feeding or resting by migrant waterfowl, and year-round habitation by muskrat and raccoon.
CHAPTER 6: GEIS

- **Buckhorn Island and Goat Island Rapids** - This zone is located between Grand Island and Goat Island, in the City of Niagara Falls, Niagara County, and the Town of Grand Island, Erie County. This 850-acre area is a wide, fast-moving, and relatively shallow section of the upper Niagara River, which extends from the Buckhorn Island water diversion structures to the Goat Island Bridge and Three Sisters Islands, including Tower Island north of the Ontario Hydroelectric project in Ontario, Canada.

The Upper Niagara River is a unique ecosystem in the western Great Lakes region of New York State containing extensive areas of undisturbed natural habitat. The Buckhorn Island-Goat Island Rapids is part of one of the most important waterfowl over wintering areas in the northeastern United States, especially for diving ducks and other waterfowl. The Buckhorn Island and Goat Island Rapids serves as a major feeding and resting area for common and red-breasted mergansers, goldeneye, scaup, mallard, and bufflehead among other waterfowl species. During the spring and fall migration seasons a variety of waterfowl use this area. Common terns and ring-billed gulls nest near Buckhorn Island, and there is a known colony of common terns located on Tower Island. The rocky shoals and swift currents of the Buckhorn Island - Goat Island Rapids also provides a favorable habitat for fish populations, which includes spawning by smallmouth bass.

- **Lower Niagara River Rapids** - This area is located below Niagara Falls in the Niagara Gorge, between the Whirlpool Rapids Bridge and the Village of Lewiston, the City of Niagara Falls and Town of Lewiston, Niagara County. This fish and wildlife habitat is an approximately four and one-half mile segment of river channel, situated in the Niagara Gorge. The Niagara Gorge is generally characterized by steep cliffs and wooded slopes, rising over 200 feet above the river. This section of the river is very narrow, deep and fast-moving. Maximum depths range from 50-160 feet.

The Lower Niagara River Rapids provide some unusual habitat conditions due to its natural physical environment and the effects of hydroelectric power projects on the area. The rapids support a productive coldwater fishery. The concentrations of steelhead that occur in the Lower Niagara River rapids are among the largest in New York State. Substantial numbers of coho salmon, chinook salmon, and brown trout also occur in the area during the spring and fall spawning periods.

Development of the Niagara Falls area, including hydroelectric power projects, generally limits resident wildlife populations to only the most commonly occurring species such as red-tailed hawk, rock pigeon, downy woodpecker, blue jay, American crow, gray catbird, American robin, common grackle, song sparrow, eastern cottontail, and raccoon. In addition, however, the Lower Niagara River rapids have one of the largest winter concentrations of gulls in western New York with the hydroelectric stations in the gorge. A variety of waterfowl species also feed in the Lower Niagara River rapids during migration periods and winter, but concentrations are limited due to the lack of resting areas. Diving ducks, such as mergansers, scaup, old squaw, and common golden eye are numerous in this area.

**11A. Impacts to Terrestrial and Aquatic Ecology** - Implementation of the Greenway Plan is anticipated to have significant beneficial impacts on terrestrial and aquatic resources over a system-wide basis along the Niagara River, and on specific habitats and sensitive areas that will
be enhanced or improved via Greenway funding. Many ecologically sensitive areas have been lost, or have been detrimentally impacted by human activity. Use of Greenway funds to protect, preserve, or restore impaired terrestrial and aquatic resources will have a significant and long-term beneficial impact on the environment and local economy.

Although the amount of fish and wildlife habitat and resources to be enhanced or restored under the Greenway Plan is not known at this time, it is clear that the opportunity exists to realize some dramatic and significant improvements in terrestrial and aquatic resources along the entire Niagara River. The extent of positive impacts will also be determined by the degree of resource degradation and the effectiveness of proposed restoration and enhancement measures.

Beneficial impacts to restoring impaired sensitive fish or wildlife habitats include environmental, social and economic impacts. The natural environment will benefit by having improved habitat for resident and migratory birds, fish and other species. Improved natural habitats will provide for improved feeding and nesting opportunities for rare, threatened and endangered species and will improve conditions for other species that reside in the region year-round. Terrestrial and aquatic enhancements will result in beneficial social impacts as they add value to aesthetic, recreational and educational opportunities available within local communities. From an economic standpoint, habitat improvement projects will result in increased property values along the waterfront, and increased use and enjoyment of the resource by birdwatchers, fisherman, and sportsmen alike.

Many individual habitat improvement initiatives and projects intended to improve terrestrial, aquatic and sensitive ecological resources have been identified by the public and interested groups during the Greenway Planning process. Individually, these projects will result in site specific impacts that are, in general, positive. Some temporary adverse impacts may result due to construction activities and localized disturbance, but these impacts will be temporary and can be mitigated or avoided during sensitive parts of the year through the use of resource sensitive construction techniques and the scheduling of work activities to avoid spawning and migration.

11B. Mitigation Measures - As adoption and implementation of the Plan itself will not result in any significant adverse impacts to terrestrial and aquatic ecology, no mitigation measures are necessary. However, adverse impacts may result from construction activities and localized disturbance to terrestrial and aquatic habitats and ecology, but these impacts will be temporary and can be mitigated or avoided during sensitive parts of the year through the use of resource sensitive construction techniques and the scheduling of work activities to avoid spawning and migration. Mitigation of short-term impacts due to site-specific construction and potential project-related erosion would be accomplished through adherence to Best Management Practices and adherence to such guidelines as DEC’s stormwater management and erosion and sediment controls.

In order to protect and preserve a significant habitat, land and water uses or development shall not be undertaken if such actions would either destroy the habitat, or significantly impair the viability of a habitat. Development of projects within the Greenway that are located in or near a Significant Coastal Fish and Wildlife Habitat are required to address potential impacts of a project on the habitat— if a federal agency permit or approval is required for the project— through the NYSDOS coastal consistency review process.
E. Cumulative Impacts
A cumulative impact is one that could result from the incremental impact of a proposed action on the environment when added to other past, present or reasonably foreseeable future actions. Cumulative impacts can result from individually minor but collectively significant actions that take place over time. Potentially, cumulative impacts associated with the proposed Niagara River Greenway plan include beneficial economic and tourism impacts, preservation and restoration of ecologically significant or unique areas, and enhanced access to and enjoyment of natural resources via linkages and trails. The net impact of these resources is expected to be positive in the context of past, ongoing and future projects, which may or may not be supported by Greenway funds.

Numerous planned or potential projects identified by various interest groups to date would result in social, economic and environmental impacts at varying levels both individually and cumulatively. Project specific impacts may include improved waterfront access. However cumulative impacts may result not only in benefits such as better trail linkages that provide improved waterfront access and a continuous lake to lake connection, but also provide linkages to ecologically significant fish and wildlife habitats as well as connections to cultural tourism destinations.

Following the criteria established in this Plan, Greenway-funded projects will be expected to be compatible with existing and future land uses and local development objectives. Given the annual and long-term nature of the funding and project approval process, individual projects will be scheduled or phased so that cumulative adverse impacts are minimized.

F. Irreversible and Irretrievable Commitment of Resources
Proposed projects will require the irreversible and irretrievable commitments of certain human, material, and financial resources. As described in Section 1 of the Plan, projects will involve the commitment of New York Power Authority relicensing settlement and other funds that will not necessarily be recouped over the long-term operation, maintenance and funding of the Greenway through job creation and retention. The commitment and expenditure of various resources will advance project goals; preserve, restore and enhance environmentally, locally and culturally significant areas within the Greenway; support and increase tourism/eco-tourism; support local economic development objectives; and contribute to an improved quality of life for residents within the Greenway and in the Buffalo-Niagara Region.

G. Unavoidable Adverse Effects
Unavoidable adverse impacts are defined as those that meet the following two criteria:

- There are no reasonable practicable mitigation measures available that would eliminate the impact; and
- There are no reasonable alternatives to the project that would meet the purpose and need of the action, eliminate the impact, and not cause other or similar significant or adverse impacts.

No significant unavoidable adverse impacts are expected to result from adoption and implementation of the Niagara River Greenway Plan.
CHAPTER 6: GEIS

Depending on the scope and location of a particular project its construction or continued operation may potentially result in localized, minor and unavoidable adverse impacts on air quality, noise, visual resources, sensitive environmental resources, and traffic and transportation. These impacts would be short-term and localized to the vicinity of the particular project, and would not be expected to impact use and quality of the Greenway as a whole. The physical alteration of sites for park, trail, greenway and/or waterway access development may cause some temporary erosion, turbidity, and sedimentation problems. These problems are generally negligible and short term especially with the systematic use of appropriate control measures and best management practice. With the expected increase in Greenway use by the public, there may be impacts such as littering, noise, and increased traffic. Appropriate mitigation measures will be employed to protect sensitive habitats and environmental resources from increased human intrusion.

Where potentially significant adverse impacts are anticipated based on the scope or location of a specific project not currently envisioned or proposed, impacts would be minimized by adherence to environmentally sound construction practices and conformance to all applicable federal, state and local regulations and guidelines. Individual projects may be expected to comply with the requirements of the State Environmental Quality Review Act, and, depending on the scope and magnitude of these projects, the National Environmental Policy Act.

H. Effects on the Use and Conservation of Energy

Depending on the nature and scope of the proposal, projects approved by the Greenway Commission will likely have minor impacts on the use of energy during construction. Construction will require the use of nonrenewable sources of energy, mostly in the form of gasoline, diesel fuel, and lubricating oils. These energy resources will be used where necessary for grading, excavation, demolition, or other activities associated with construction, operation or project maintenance.

The use of energy for project operation is negligible, and would likely remain consistent with current use. While some projects will result in energy conservation by increasing access to passive recreational opportunities (walking, jogging, hiking along newly linked paths, thereby reducing automobile use), others may result in indirect energy use. Employees, visitors, and boaters would utilize gasoline for travel and recreation; or a visitor center could require the use of natural gas and electricity for the heating and cooling of buildings. Any estimates for the energy resources or uses described above would be speculative, however they would not be considered significant based on the types of projects that have been identified to date for potential funding.

I. Growth Inducing Aspects of the Proposed Action

Funding of specific projects may induce localized growth associated with a particular destination or industry. This growth is considered positive and consistent with the economic development goal that is inherent within the Greenway Plan, and was one of the intents of the Governor/State Legislature in drafting and passing the legislation which mandated that this Plan be prepared.

It is expected that the Plan will induce growth in the tourism and related service industries, although much of the growth will be seasonal in nature. Seasonal growth would be expected in the areas including, but not limited to, eco-tourism (bird watching), cultural/heritage tourism, hunting/fishing opportunities, recreational boating, and dining/entertainment at establishments...
CHAPTER 6: GEIS

located along the Niagara River. As the Plan is implemented and the use and viability of these destination-induced activities increases, seasonal growth would also be realized directly and indirectly via purchasing/spending of out-of-the-area visitors in the areas of lodging, car rental, restaurants, and other commercial/retail and related service and entertainment industries (i.e. visiting retail outlet malls, amusement parks, casino, etc) within the Greenway communities.

Increased use/visitation within the Greenway resulting from this Plan may also result in induced seasonal growth outside of the Greenway communities. For example, visitors to attractions/destinations within the Greenway may also stay in the Erie/Niagara county area for non-Greenway activities such as to attend a professional sporting event; see a play or musical in downtown Buffalo; visit architectural gems such the Frank Lloyd Wright’s Graycliff estate or the Roycroft Campus; attend the Ellicottville Jazz Festival; or follow the Wine Trail in Niagara County.

Implementation of the Greenway Plan will not result in increased residential growth in the affected municipalities. The Plan will not result in extensions of roadway, water or sewer infrastructure into previously undeveloped areas. This project will neither increase nor influence the flow of trade, goods, services or vehicles crossing any of the international bridges that traverse the Niagara River.

J. Future Environmental Reviews

There are two types of possible future environmental reviews. First, projects that are undertaken, approved or funded by a state agency or municipality are required to demonstrate compliance with the State Environmental Quality Review Act (SEQR). The site specific impacts and mitigation of these projects will be assessed individually by the designated lead agency under SEQR. The lead agencies will use the information in this Plan/GEIS as an aid in their assessment of impacts under SEQR. Such projects may be found to be consistent with the information and Findings of this Plan/GEIS and this can be so stated in the lead agency’s environmental review. In the end, however, the lead agency will be responsible for compliance with SEQR and issuance of a SEQR Determination of Significance.

The second possible type of environmental review is a review that supplements this Plan/GEIS. This Plan/GEIS addresses among other items the 15 elements specified by the legislation creating the Greenway Commission. Should there, in the future, be additional elements added or significant modifications made to the elements addressed in this Plan/GEIS, an assessment would be required to determine if such change may result in a significant adverse impact under SEQR. If this is the case, a supplemental review under SEQR would be required. If the changes to the Plan/GEIS would not result in such impacts, the Commission can either issue a determination of consistency with the Plan/GEIS or prepare an environmental assessment. If the Findings from such an assessment demonstrate the absence of any significant adverse impacts, a Negative Declaration could be issued in compliance with SEQR.
CHAPTER 7: COMMENTS AND RESPONSES

7.0 COMMENTS AND RESPONSES

This section contains the responses to the comments received by the Office of Parks, Recreation and Historic Preservation (OPRHP), as Lead Agency, for the Niagara River Greenway Plan and Draft Generic Environmental Impact Statement (GEIS). The draft plan/GEIS was released for public review on November 27, 2006. Two public hearings were held. The hearing in Niagara County was held on December 12, 2006 at the Niagara Falls Convention Center, Niagara Falls, NY. The hearing in Erie County was held on December 13, 2006 at the Buffalo and Erie County Historical Society, Buffalo, NY. Both meetings were well attended, with approximately 70 to 100 attendees at each meeting. A total of 34 attendees made verbal statements on the first night, and 32 attendees spoke on the second night. Several attendees also provided written materials for the record. Transcripts of both meetings have been entered into the comment record, as well as written materials provided by attendees.

The public comment period closed on January 17, 2007. During the comment period, the Agency received an additional 28 comment letters and e-mails providing input on the draft Niagara River Greenway Plan and Draft GEIS. Together, a total of 128 comments (written and verbal) were provided to the Agency. A list of persons and organizations who attended the hearings and/or provided comments is contained at the end of this chapter.

The types of comments received included general support for the concept of a Niagara River Greenway, additional stakeholder input, questions about procedural or organizational issues and comments relating to specific aspects of the plan. Other comments pertained to aspects of the Niagara River Greenway that are outside the scope of this document or outside the legislative authority of the Niagara River Greenway Commission. All comments were reviewed and subsequently organized by categories. Section A of this Chapter is a summary of changes made to the draft Plan and DGEIS. Section B of this Chapter is a listing of the comments received; grouped and summarized into categories. Under each category is the Agency’s response to the comments. The order of the categories is random, and does not reflect their importance.

The Niagara River Greenway Commission and OPRPH appreciates the time and effort that persons interested in the Niagara River Greenway have invested in their review and comments on the Draft Plan and Draft GEIS and their participation in the public hearings.

A. Summary of Changes to the Plan and GEIS

The Niagara River Greenway Commission has revised the draft Niagara River Greenway Plan and Generic Environmental Impact Statement in response to the many constructive comments that it has received from the public and municipal stakeholders. While none of the changes are significant or change the intent of the plan, these changes clarify various provisions and concepts. The following list summarizes the changes that were incorporated into the document between the Draft Plan for Public Review and the Final Plan.

- Minor editorial changes throughout, to catch typographic errors, improper references grammatical errors.
- Page i: Revised Vision Statement (see page 19, below)
- Page iv: additional language clarifying relationship with relicensing settlement efforts
- Page iv: add “parks” (see page 29-30, below)
- Page iv-v: Geographic Priority reworded to Focus Area (see page 32, below)
- Page v: clarification regarding evidence of public support (see page 33, below)
CHAPTER 7: COMMENTS AND RESPONSES

- Page v: remove last sentences under “Economic Viability” and “Matching Funds/Leveraging” to be consistent with revisions in body of report (see page 33, 34)
- Page v: reword to “consideration of” other planning efforts (see page 35, below)
- Page viii: add “acquisition” as potential ecological project type
- Page 8: Revisions to discussion of boundary:
  - Rephrase “Priority” area to “Focus” area – this revision is carried out throughout the report
  - Additional language regarding connecting systems
- Page 11: additional text describing connections to Greenway
- Page 13: additional text (from GEIS chapter) about ecological resources
- Page 13: added sentence stating there are efforts underway to capitalize on architectural, industrial and historical resources
- Page 14: added text supporting open space preservation, noting that school district and county are potential stewards of open space
- Page 16: clarification regarding LWRP status, added text about benefits of LWRP
- Page 17: additional Municipal Planning Documents listed
- Page 18: addition to list of Additional Planning Documents
- Page 19: revision to Vision Statement. Vision Statement now states:
  - “The Niagara River Greenway is a world-class corridor of places, parks and landscapes that celebrates and interprets our unique natural, cultural, recreational, scenic and heritage resources and provides access to and connections between these important resources while giving rise to economic opportunities for the region”
- Page 20: sentence added noting economic and tourism opportunities from ecological, heritage, recreational and cultural resources
- Page 22: additional description of intent of principles
- Page 23: add sentence re. quality of life
- Page 27: in text box: change “geographic priority” to “focus area”; change “economic feasibility” to “economic viability”; change “consistency with other planning efforts” to “consideration of other planning efforts”
- Page 29-30: reworded to state “Development of an integrated trail and park system”
- Page 32: Item 3: Geographic Priority: reworded to “focus”
- Page 33: Item 5: Implementable: word “reasonable” deleted
- Page 33: Item 5: Implementable: clarification that evidence of public support includes municipal resolution, public records or correspondence.
- Page 33: Item 6: Economic Viability: reworded for clarification of intent- evidence of support for on-going O&M costs; not economic impact or economic feasibility analysis.
- Page 34: Item 8: Matching Funds: removes last sentence
- Page 35: Item 9: Retitled from Consistency to Consideration of Other Planning Efforts; insertion regarding LWRPs.
- Page 35: Item 10: Clear Benefits: insertion to clarify intent, which is to maximize beneficial impacts to environment, economy and the region.
- Page 35-36: Funding Sources: additional language clarifying relationship between Greenway Commission and Relicensing Settlement Funds; adding language regarding DOS grants
CHAPTER 7: COMMENTS AND RESPONSES

- Page 37: Operations and Maintenance: added language clarifying that estimates of costs are informational only, and each project sponsor must make their own best estimate of on-going O&M costs.
- Page 43: Additional language regarding Greenway Commission and other funding sources; additional language about eminent domain; additional language about procedures for amending the plan.
- Page 45: Additional language noting transportation processes incorporate intermunicipal notification and cooperation; additional language noting that the NRGC does not have legal authority to dictate how governmental agencies undertake transportation projects.
- Page 45: Additional language per LWRPs and consistency review.
- Page 45: clarification of reference to I-190 – a replacement route would not be an interstate.
- Page 49: additional language noting implementation concepts are conceptual, and do not preclude other concepts and solutions.
- Page 53: additional language noting potential trail alignments are concepts and other solutions would be possible.
- Page 59: clarification due to removal of I-190 SB tolls.
- Page 86: additional language recognizing there are many ways to devise ecological projects that benefit the Niagara River ecosystem.
- Page 97: Niagara Wine Trail added as connecting feature.
- Page 101: Vision statement addition, per page 19, above.
- Page 104: Indian Nations added as Section C.
- Page 106: additional language clarifying impacts will be regional in nature.
- Page 110: clarifying language about Coastal Zone Management Consistency.

Appendix A: no changes.
Appendix B: no changes.
Appendix C: add text from relicensing settlement agreements per the four funds.
Appendix D: additional language regarding available grant programs (EPF, US Army Corps of Engineers, Scenic Byway).
Appendix E: additional input per public comments, Indian Nations as separate list.
Appendix F: no changes.
Appendix G: revisions clarifying references to Relicensing agreements.

FIGURE CHANGES:
(only figures with revisions listed: all other figures are unchanged)

Figure 1: Niagara River Greenway Boundary......... Add connecting systems, clearer boundary.
Figure 2: State, County and Local Parks .................................................Add some local parks.
Figure 3: Trailways and Byways................................................. Changes to legend (corrections).
Figure 7: Heritage................................................................. Add some locally significant sites.
Figure 8: Geographic Priority Area................................. Re-titled; minor revisions to boundary.
CHAPTER 7: COMMENTS AND RESPONSES

B. Comments and Responses

This section summarizes the substantive comments received by category and provides the Agency’s responses to those comments.

Comment: Boundary
Several comments related to the question of the proposed boundary for the Niagara River Greenway.

Response:
The issue of the boundary for the Greenway received extensive discussion and study during the preparation of the draft plan. The Niagara River Greenway Commission, after careful consideration, established the boundary of the Greenway along municipal lines, as shown in Figure 1 of the draft plan. The Commission recognizes that the Niagara River forms the core of the Greenway, and a focus area, referred to as a ‘priority area’ in the Draft report, has been established that encourages efforts to be focused along the River and its adjacent resources, as shown in Figure 3. The focus area is not to be interpreted as the boundary of the Greenway, which follows municipal lines.

There was confusion with the use of the term ‘priority’ in the Draft report, which implied a time limit to the core area along the river. In the Final Plan, therefore, the ‘priority’ area is now called the ‘focus’ area. Revisions to the boundaries of the focus area represent local adjustments.

The Greenway Commission also acknowledges that there are important connections to the Greenway boundary, including several State-designated trails: the Seaway Trail, the Niagara
CHAPTER 7: COMMENTS AND RESPONSES

Wine Trail and the Erie Canalway. Projects that enhance these and similar connections are consistent with the Greenway. The Plan narrative has been revised to provide greater detail about the designated connections to the Niagara River Greenway.

Comment: NYPA Relicensing Settlement Greenway funds
Several comments raised concerns about how NYPA Relicensing Settlement Greenway funds are structured or where they would be spent.

Response:
The New York Power Authority (NYPA) Relicensing Settlement Greenway funds were established as part of the federal relicensing of the Power Project. The Niagara River Greenway Commission was not involved in those negotiations, and has no legal standing to suggest revisions to these agreements. The allocation of the NYPA Relicensing Settlement Greenway funds will be determined by the Standing Committees established under those agreements. The relicensing agreements indicate that any individual or organization may propose a project, but the Standing Committees have the sole responsibility for selecting projects, provided that the proposed project is consistent with the Niagara River Greenway Plan. The criteria included in the plan are designed to guide evaluation of consistency and promote the selection of projects that will enhance the Greenway.

Comment: Consultation Process
A number of comments addressed the Niagara River Greenway Commission’s role in regard to the ‘Greenway’ Relicensing Settlements and the Standing Committees and the process for applying for funds.

Response:
The Niagara River Greenway Commission is not a party to the relicensing agreements, and does not have any direct role over the project funding process. All Project Sponsors, however, have the obligation to consult with the Niagara River Greenway Commission and the Standing Committees are obligated to ensure that the proposed project is consistent with the Niagara River Greenway Plan. The Plan sets forth the principles that projects should promote, and these criteria will guide the consistency review. No specific projects are endorsed by the plan.

The specifics of the consultation process that will be used is an administrative matter that is outside the scope of this document. The Niagara River Greenway Commission is in the process of developing a model for this consultation process, which will be circulated for review and comment prior to implementation.

Comment: Non-Greenway funds
The Plan should spell out the Commission’s role vis-à-vis greenway projects funded by sources other than NYPA.

Response:
While the Niagara River Greenway Commission has no official stature with regard to funding sources other than the Greenway funds established as part of the NYPA Relicensing Agreements,
it will encourage and support worthwhile projects seeking other sources of funding. Appendix D of the plan includes a list of potential funding sources for Greenway-related projects.

Comment: Project Listings
Listing certain projects in the plan could give them an advantage in applying for money.

Response:
As stated in Section 5, the presentation of projects submitted by municipalities, stakeholders or the Indian Nations does not in any way imply endorsement by the Niagara River Greenway Commission. The Niagara River Greenway Commission recognizes that the list is not comprehensive, and that additional worthy projects may be formulated over the next years and decades. Each project must be evaluated individually on its own merits.

Comment: Legislation
Some comments suggested changes to the enabling legislation for the Niagara River Greenway.

Response:
Legislative changes are outside the scope of this document, and can only be addressed by the proper legislative bodies.

Comment: Amendment
No part of the plan outlines how it may be amended over the next 50 years.

Response:
A section addressing amendments to the plan has been added.

Comment: Economic Development
Nowhere in the document does it state that economic development projects would be eligible for funding.

Response:
The Niagara River Greenway Commission does not have control over which projects will be funded, which is under the jurisdiction of the Standing Committees created as part of the contractual agreements with the New York Power Authority. Economic revitalization, particularly of urban centers, is a goal of the Greenway. The phrase “while giving rise to economic opportunities for the region” has been added to the Vision Statement for the Niagara River Greenway. Appropriate economic development projects would be considered consistent with the Niagara River Greenway Plan as long as they are compatible with the principles of the Plan.

Comment: Brownfield Revitalization
DGEIS page 111 talks about cleanup and redevelopment of brownfields requiring that they be subject to review by NYSDEC. For projects that are not on hazardous waste sites or which do...
not want or require tax credits, requiring this review by DEC could severely delay projects and provides jurisdiction to DEC where it has none.

Response:
Regulatory reviews of brownfields will be conducted as required by New York State. No additional jurisdiction is granted or implied by this Plan. The phrase that references DEC has been deleted to avoid confusion over this fact.

Comment: Conflict of Interest
The Greenway Commission, if it is to review specific projects, should adopt conflict of interest guidelines for its members.

Response:
The Niagara River Greenway Commission has an adopted Conflict of Interest Policy which is available from the Commission for review. The proposed consultation procedure, when it is developed, will be consistent with ethical standards. The Niagara River Greenway Plan does not advocate specific projects. In the future, as individual project are evaluated for consistency, individual Commissioners may need to recuse themselves if there is a potential for a conflict of interest. This situation is addressed in the Conflict of Interest Policy.

Comment: Property Rights
Projects should take the input of private property owners into consideration.

Response:
The plan is conceptual in nature and does not advocate any specific projects. All future project implementation would be subject to all applicable regulations and procedures, as required under local, state and federal laws. It is the obligation of the responsible governmental entity to inform private property owners of any actions that may affect them.

Comment: Eminent Domain
The Niagara River Greenway Commission should not seek nor support legislation granting to it the power of eminent domain, nor seek nor support the exercise of such power by any New York Department or Agency without a specific agreement of the affected municipalities.

Response:
The Niagara River Greenway Commission is prohibited from taking property by eminent domain, and this prohibition is clearly stated in the enabling legislation at § 39.09 Powers and duties of the commission. The Niagara Greenway Commission will not seek to obtain the power of eminent domain. State Agencies are required to comply with New York State Eminent Domain Procedure Law, which establishes the exclusive procedure by which property shall be acquired by the power of eminent domain in New York State. That legislation includes requirements for public participation in the planning of public projects necessitating the exercise of eminent domain. Language was added to Chapter 4 of the Plan to clarify the Commission’s position regarding eminent domain.
CHAPTER 7: COMMENTS AND RESPONSES

Comment: Transportation Concerns
The Plan should include a declaration that the Commission would not support or seek any changes in Federal, State or County roads serving two or more municipalities without specific agreement to such change among the municipalities so affected. Several commenters argued that the Plan should advocate the removal of the Robert Moses Parkway.

Response:
This issue is beyond the jurisdiction of the Niagara River Greenway Commission, which does not have the legal authority to dictate how governmental agencies undertake transportation projects. As noted in Chapter 4 (subsection F) in the discussion on Transportation Issues, before entering the design and construction phases, a specific transportation project is required to undergo a specific public scoping process to study alternatives, assess potential impacts and select a preferred solution. New York State underwent such a scoping process for a portion of the southern section of the Robert Moses Parkway in Niagara County, west of the Daly Boulevard interchange (which is currently entering the preliminary and final design phases), and is initiating such a process for the north sections of the Parkway. Any other recommended transportation projects would be required to undergo similar procedures. While the Niagara River Greenway Plan has established general principles that the State must take into consideration in their assessment of alternatives, the Commission has no direct influence on that independent process.

Comment: Homeland Security
It is a glaring deficiency of the Draft plan that the security issue is not addressed and there is no mention of possible terrorist threats at the Niagara Power Project.

Response:
Security issues at the Niagara Power Project are the responsibility of the New York Power Authority and outside the jurisdiction of the Niagara River Greenway Commission. Security in general is the responsibility of Federal, State and local law enforcement agencies, not the Niagara River Greenway Commission.

Comment: Future Study
Respondent was concerned that the plan does not mention the need for a master plan for the Niagara Gorge.

Response:
The Niagara River Greenway Plan is conceptual in nature. There are several important assets, including the Niagara Gorge, where further study will be necessary. The fact that they are not specifically addressed within the plan does not imply that they are not important. Due to the special significance of the Niagara Gorge, the Niagara River Greenway Commission acknowledges that an area-specific Master Plan should be developed for the Niagara Gorge.

Comment: Inventory
Certain local parks and greenspaces are not included. Several places and projects key to the Greenway vision are omitted.
CHAPTER 7: COMMENTS AND RESPONSES

Response:
All State, County and local parks are depicted on Figure 2. Where specific omissions have been noted, editorial changes have been made to the inventory. The table of State Parks and Public Lands included in the document only lists State-owned facilities, but local and county parks are also important resources along the Greenway. Key features, such as the Outer Harbor, Goat Island and the Niagara Gorge all fall within the designated focus area and the Commission affirms their importance to the Greenway.

Comment: Canada
It is important that we reach out to the Canadian government and provinces. The Plan does not address this.

Response:
The Plan considers connections to Canada in the form of Gateways, interpretive linkages and programming. The Niagara Greenway Commission intends to continue to work toward greater cooperation across the region and with Canada.

Comment: Connections
The proposed draft greenway boundary map fails to label the three designated trail corridors (Seaway, Wine and Erie Canal) in Niagara County.

Response:
The issue of the boundary for the Greenway received extensive discussion and study during the preparation of the draft plan. The Niagara River Greenway Commission, after careful consideration, established the boundary of the Greenway along municipal lines, as shown in Figure 1. It is recognized that the Niagara River forms the core of the Greenway, and a focus area, which was called a ‘priority area’ in the Draft report, has been established that encourages efforts to be focused along the River and its adjacent resources, as shown in Figure 3. The focus area is not to be interpreted as the boundary of the Greenway, which follows municipal lines.

There was confusion with the use of the term ‘priority’ in the Draft report, which implied a time limit to the core area along the river. In the Final Plan, therefore, the ‘priority’ area is now called the ‘focus’ area. Minor adjustments to the focus area were made in response to comments by localities requesting that specific assets, such as a creek corridor or proposed trail system, fall within the focus area.

The Greenway Commission also acknowledges that there are important connections to the Greenway boundary, including several State-designated trails: the Seaway Trail, the Niagara Wine Trail and the Erie Canalway. Projects that enhance these and similar connections are consistent with the Greenway. The Plan narrative has been revised to provide greater detail about the designated connections to the Niagara River Greenway.

Comment: Vision Statement
The report’s vision and vision statement fail to offer language that supports linking both municipal and state designated trails and conservation areas that may be developed.
Furthermore, the report fails to take into account the use of municipal comprehensive plans and countywide planning related documents, which will play an important role in supporting the report’s vision. The report’s vision statement fails to recognize “economic development,” “tourism,” or “education.”

Response:
The Vision Statement supports linking trails and conservation areas together, with the phrase “connections between these important resources.” It does not distinguish between existing resources and those which may be developed, or explicitly reference local planning efforts because the Vision Statement is intended to be a succinct statement that will remain relevant for years into the future. The fact that reference to local planning efforts is not contained within the Vision Statement does not mean it is not important. The text of the Plan clearly acknowledges the importance of local planning efforts.

In response to various comments, the phrase “while giving rise to economic opportunities for the region” has been added to the Vision Statement for the Niagara River Greenway. To further support the importance of tourism and economic development as an element of the Niagara River Greenway, the following sentence has been added to the end of the section The Niagara River Greenway is a place to celebrate and interpret shared resources: “The Greenway presents an opportunity to contribute to the economy of the region by promoting economic and tourism opportunities that capitalize on the region’s rich inventory of ecological, heritage, recreational and cultural resources.”

Comment: Open Space
While the report recognizes the state’s importance to preserve open space, there is no mention of municipal or county efforts to preserve open space, even though preservation of open space is identified in existing municipal plans. The school districts may also undertake projects that require acquisition or dedication to further enhance the greenway.

Response:
Although the New York State Open Space Plan was used to establish priorities for open space acquisition and/or preservation, the Plan clearly notes that stewardship of open space will be accomplished by a range of entities. Editorial changes have been made to note that acquisition is an acceptable method of open space preservation and to note that the list of potential stewards of open space includes counties and school districts. The Niagara River Greenway Plan supports open space preservation, prioritizing significant ecological areas, areas that provide recreational opportunities, and/or promote water resource protection. It supports existing local efforts, and encourages future activities toward this goal. The Plan does not explicitly list all specific tools that can be used to encourage open space preservation in order to avoid limiting options, and to enable maximum flexibility to the local project sponsors in developing appropriate methods for achieving their open space goals. While Chapter 4 identifies potential project types, it does not preclude other options.

Comment: Local Waterfront Revitalization Programs (LWRPs)
Requests clarification on LWRP status of various municipalities.
CHAPTER 7: COMMENTS AND RESPONSES

Response:
Editorial changes have been made to reflect the fact that seven of the eleven communities fronting the Niagara River have prepared Local Waterfront Revitalization Programs (LWRPs) pursuant to Article 42 of the NYS Executive Laws. This list includes the Town of Grand Island, whose LWRP was approved by New York State in December 2006. While the City of Niagara Falls does not have an LWRP, it has completed a waterfront plan. The Town of Niagara and the Village of Kenmore do not have waterfront lands.

Comment: Industrial Heritage Initiatives
The report fails to mention the industrial heritage initiatives being undertaken in the area as well as those initiatives that could be implemented in the future.

Response:
It is agreed that the region’s rich industrial heritage is integral to the development of heritage tourism within the region. It is recognized that there are industrial heritage initiatives being undertaken, particularly in the Cities of Niagara Falls and Buffalo. It is recommended that a Heritage Plan be undertaken for the Niagara River Greenway that will inventory existing historic resources and seek to develop themes and methods for interpreting these resources. Additional language has been added to the Plan to underscore the importance of industrial heritage.

Comment: Upland and Interior Communities
The report fails to provide solid language that links the draft greenway boundary to upland and interior communities. While references are made sporadically in the report, only one small section titled “Linkages” highlights the trails. There is no discussion or recommendation given “how” the greenway could be linked to upland and interior communities to provide linkages to the river.

Response:
The issue of connections between the Greenway and upland and interior communities is addressed in the response on “Connections” above. The Plan contains no discussion on “how” to link the Greenway because it is the plan’s intent to provide the flexibility to allow the project sponsors to describe their projects and how they contribute to linkages. In addition, several of these trails have their own plans which projects would need to adhere to. It is emphasized that the Greenway Plan does not endorse any specific projects; conversely, omission from the Plan does not disqualify future project concepts.

Comment: Regional Approach
The concept of a greenway as described in the legislation impacts the region as a whole. The report’s discussion of economic development focuses on the urban centers and fails to address activities region wide. While development in urban areas is important, there needs to be elements added that relate to economic development at all municipal levels. Ensuring that the diverse types of communities in the region are represented will further strengthen the support of a greenway plan.
CHAPTER 7: COMMENTS AND RESPONSES

Response:
Economic revitalization is a goal of the Greenway. The phrase “while giving rise to economic opportunities for the region” has been added to the Vision Statement for the Niagara River Greenway to underscore this fact. While the Plan includes a focus on the redevelopment of urban areas, this does not mean that other economic development activities are excluded. Appropriate economic development projects will be considered consistent with the Niagara River Greenway Plan as long as they are consistent with the principles of the Plan.

Comment: Consistency with Principles
Several of these principles do not mirror the 15 elements the legislation states the Greenway Plan must address. The principles in most respects are mutually exclusive to the Niagara River and not to municipalities as the draft boundary suggests.

Response:
The principles are intended as a guide to actions and development over the long-term, so that the cumulative effect of projects is to move toward achieving the shared vision for the Niagara River Greenway. The principles are applicable to municipalities without waterfront lands as well as those fronting the River. They promote access and connections, including trail linkages. They support high quality, ecologically-sound projects throughout the region.

The enabling legislation presents a list of fifteen elements that the Niagara River Greenway Plan must address, and the Plan does address each of these points. These fifteen elements, however, are not the same as the criteria that have been developed to help the Niagara River Greenway Commission evaluate projects. The criteria, which were built from previous planning efforts and extensive public input, are intended to provide stronger guidance for project sponsors as to the types of projects that would help promote the Greenway.

Comment: Priority Status
There was concern that the priority status criterion was too restrictive, particularly for communities with no waterfront lands.

Response:
It is not the intent of this criterion, which is one of 10, to exclude projects submitted by communities with no waterfront lands. Editorial changes have been made to clarify that the development of an integrated trail and park system would be consistent, and that connecting trail systems are also consistent. All proposed projects will be evaluated based on the totality of the project.

Comment: Geographic Priority
There was confusion over the geographic priority criterion.

Response:
The terminology “Geographic Priority” has been changed to “Focus Area,” and references to ‘priority’ have been adjusted to reflect this change. Editorial changes note that projects close to the River, within the municipal boundaries of the Greenway, along state-designated trails and
related assets should be elevated. Projects outside the focus area should help establish strong linkages between the Greenway core area and the surrounding area.

As noted in the response on “Boundary” above, the focus area encourages activities along the River. However, it does not preclude projects outside of the focus area. Municipalities without waterfront lands, or whose waterfront lands are already developed, will develop their own priorities. The Plan provides flexibility to allow for projects away from the water, as long as they benefit or enhance the Niagara River Greenway.

Comment: Environmental Soundness
There were questions regarding the environmental soundness criterion.

Response:
The intent of this criterion is to encourage activities to consider environmental soundness in their design and implementation. Editorial changes have been made to clarify this intent.

Comment: “Implementable”
There was a question as to how evidence of public support would be documented.

Response:
Editorial changes make it clear that evidence of public support include municipal resolution, public records or correspondence.

Comment: Economic Feasibility
There was a question regarding economic “viability” vs. “feasibility.”

Response:
Use of the word “feasibility” was an editing oversight which has been changed to “viability.” The intent of this criterion is to ensure that project sponsors have considered projects’ on-going operation and maintenance costs, as is required under the legislation, and editorial changes clarify this intent. This criterion does not imply that all projects must demonstrate economic impacts, and the Niagara River Greenway Commission will not require economic feasibility analyses from project sponsors.

Comment: Matching Funds/Leveraging
There was concern that the Plan misrepresented the dedicated funding through NYPA Relicensing Agreements.

Response:
Editorial changes to the Plan have been made to state that the Niagara River Greenway Commission recognizes the efforts of the New York Power Authority to settle with various municipalities and interests in relation to a new 50-year Niagara Power Project License. The Niagara River Greenway Commission is not a party to these agreements and will not provide an interpretation of their intent, which can be derived from the documents themselves. Appendix C of the Niagara River Greenway Plan now provides the relevant sections of the Agreements for the
Niagara River Greenway Ecological Fund, the State Parks Greenway Fund, the Greenway Recreation/Tourism Fund and the Erie County Greenway Fund as reference.

Comment: Clear Benefits
Commenter noted a lack of clarity regarding intent of this criterion.

Response:
The intent of this criterion is to ensure project sponsors think about how to structure their proposals to maximize the beneficial impacts to the environment, to the economy and to the region. Terms have not been defined to allow flexibility to project sponsors to make their own case.

Comment: Operations & Maintenance (O&M) Costs:
There was concern over the figures provided as illustrative O&M costs.

Response:
The cost estimates are provided for informative purposes only. It is the responsibility of each project sponsor to make their best estimate of the on-going costs of their projects.

Comment: Transportation Projects:
There was concern about the issue of maximizing access.

Response:
The Plan presents recommendations, but not requirements. Emphasizing access to the River and its resources is encouraged, but not mandated. Each project, including projects sponsored by the NYS Department of Transportation, must undergo their own evaluation of consistency with the Plan.

Comment: Implementation Concepts
There were several questions regarding the nature of the Implementation Concepts, and concern that specific concepts were not included.

Response:
The Implementation Concepts are conceptual in nature, and they do not preclude additional concepts and solutions.

Comment: DGEIS
A question was raised as to why county level figures were used in the DGEIS.

Response:
County-level and regional figures were utilized due to the generic nature of the Environmental Impact Statement. The GEIS was designed to assess the impacts of the Plan itself, as a document,
CHAPTER 7: COMMENTS AND RESPONSES

and not any future projects that may result. Future projects may be required to undergo their own environmental reviews, based on the specifics of the project.

In general, the Niagara River Greenway Plan, when implemented, will provide benefits on a regional basis. Improved environmental quality, improved tourism development, improved connections to the Niagara River, direct/indirect economic activity and improved quality of life will provide real and substantial beneficial impacts that extend beyond the Greenway boundaries.

Comment: APPENDIX E
Omissions in Appendix E were noted.

Response:
These omissions were an editing oversight and have been corrected.

Comment: Editorial Changes
Several comments requested specific editorial revisions to language within the Draft Niagara River Greenway Plan.

Response:
Please see the summary of Plan Changes in Section A of this chapter for a listing of the editorial changes that were made to the document.

Comment: Support
Several comments expressed overall support for the plan or support for elements of the plan.

Response:
These comments are noted and appreciated.

The following table provides a list of the persons that provided comments on the Draft Niagara River Greenway Plan and Draft Environmental Impact Statement.
